# ON THE DERIVATIVE AND MAXIMUM MODULUS OF A POLYNOMIAL 

K. K. DEWAN, N. K. GOVIL, ABDULLAH MIR, AND M. S. PUKHTA

Received 2 October 2004; Accepted 11 October 2004

If $p(z)=\sum_{v=0}^{n} a_{v} z^{v}$ is a polynomial of degree $n$, having all its zeros in $|z| \leq 1$, then it was proved by Turán that $\left|p^{\prime}(z)\right| \geq(n / 2) \max _{|z|=1}|p(z)|$. This result of Turán was generalized by Govil, who proved that if $p(z)$ has all its zeros in $|z| \leq K, K \geq 1$, then $\max _{|z|=1}\left|p^{\prime}(z)\right| \geq$ $\left(n /\left(1+K^{n}\right)\right) \max _{|z|=1}|p(z)|, K \geq 1$. In this paper, we sharpen this, and some other related results.

## 1. Introduction and statement of results

If $p(z)=\sum_{v=0}^{n} a_{v} z^{v}$ is a polynomial of degree $n$, then it is well known that

$$
\begin{equation*}
\max _{|z|=1}\left|p^{\prime}(z)\right| \leq n \max _{|z|=1}|p(z)| . \tag{1.1}
\end{equation*}
$$

The above inequality, which is an immediate consequence of Bernstein's inequality on the derivative of a trigonometric polynomial, is best possible with equality holding for the polynomial $p(z)=\lambda z^{n}, \lambda$ being a complex number.

If we restrict ourselves to the class of polynomials having no zeros in $|z|<1$, then the above inequality can be sharpened. In fact Erdös conjectured and later Lax [7] proved that if $p(z) \neq 0$ in $|z|<1$, then

$$
\begin{equation*}
\max _{|z|=1}\left|p^{\prime}(z)\right| \leq \frac{n}{2} \max _{|z|=1}|p(z)| . \tag{1.2}
\end{equation*}
$$

If the polynomial $p(z)$ of degree $n$ has all its zeros in $|z| \leq 1$, then it was proved by Turán [9], that

$$
\begin{equation*}
\max _{|z|=1}\left|p^{\prime}(z)\right| \geq \frac{n}{2} \max _{|z|=1}|p(z)| . \tag{1.3}
\end{equation*}
$$

2 On derivative and maximum modulus of a polynomial
The inequalities (1.2) and (1.3) are also best possible, and become equality for polynomials which have all its zeros on $|z|=1$.

The above inequality (1.3) of Turán [9] was generalized by Govil [3], who proved that if $p(z)$ is a polynomial of degree $n$ having all its zeros in $|z| \leq K$, then

$$
\begin{align*}
& \max _{|z|=1}\left|p^{\prime}(z)\right| \geq \frac{n}{1+K} \max _{|z|=1}|p(z)|, \quad \text { if } K \leq 1,  \tag{1.4}\\
& \max _{|z|=1}\left|p^{\prime}(z)\right| \geq \frac{n}{1+K^{n}} \max _{|z|=1}|p(z)|, \quad \text { if } K \geq 1 \tag{1.5}
\end{align*}
$$

Both the above inequalities are best possible, with equality in (1.4) holding for $p(z)=$ $(z+K)^{n}$, while in (1.5) the equality holds for the polynomial $p(z)=z^{n}+K^{n}$. The inequality (1.4) was also proved by Malik [8].

The inequality (1.5) was later sharpened by Govil [4, page 67], who proved the following theorem.

Theorem 1.1. If $p(z)=\sum_{v=0}^{n} a_{v} z^{v}, a_{n} \neq 0$, is a polynomial of degree $n$ having all its zeros in $|z| \leq K, K \geq 1$, then

$$
\begin{align*}
\max _{|z|=1}\left|p^{\prime}(z)\right| \geq & \frac{n}{1+K^{n}} \max _{|z|=1}|p(z)| \\
& +\frac{n\left|a_{n-1}\right|}{K\left(1+K^{n}\right)}\left(\frac{K^{n}-1}{n}-\frac{K^{n-2}-1}{n-2}\right)+\left|a_{1}\right|\left(1-\frac{1}{K^{2}}\right) \tag{1.6}
\end{align*}
$$

if $n>2$, and

$$
\begin{equation*}
\max _{|z|=1}\left|p^{\prime}(z)\right| \geq \frac{n}{1+K^{n}} \max _{|z|=1}|p(z)|+\frac{K^{n}-1}{K^{n}+1}\left|a_{1}\right| \tag{1.7}
\end{equation*}
$$

if $n=2$.
The above inequalities are best possible and are attained for the polynomial $p(z)=z^{n}+$ $K^{n}$.

In this paper, we prove the following refinement of Theorem 1.1, which in turn gives the refinements of inequalities (1.3), and (1.5).
Theorem 1.2. If $p(z)=\sum_{v=0}^{n} a_{v} z^{v}, a_{n} \neq 0$, is a polynomial of degree $n$ having all its zeros in $|z| \leq K, K \geq 1$, then

$$
\begin{align*}
\max _{|z|=1}\left|p^{\prime}(z)\right| \geq & \frac{n}{1+K^{n}}\left\{\max _{|z|=1}|p(z)|+\min _{|z|=K}|p(z)|\right\}+\left|a_{1}\right|\left(1-\frac{1}{K^{2}}\right) \\
& +\frac{n\left|a_{n-1}\right|}{K\left(1+K^{n}\right)}\left(\frac{K^{n}-1}{n}-\frac{K^{n-2}-1}{n-2}\right) \tag{1.8}
\end{align*}
$$

if $n>2$, and

$$
\begin{equation*}
\max _{|z|=1}\left|p^{\prime}(z)\right| \geq \frac{n}{1+K^{n}}\left\{\max _{|z|=1}|p(z)|+\min _{|z|=K}|p(z)|\right\}+\frac{K^{n}-1}{K^{n}+1}\left|a_{1}\right| \tag{1.9}
\end{equation*}
$$

if $n=2$.
Both the above inequalities are best possible and are attained for the polynomial $p(z)=$ $z^{n}+K^{n}$.

If we take $K=1$ in the above theorem, we get the following result, which was proved by Aziz and Dawood [1].

Corollary 1.3. If $p(z)=\sum_{v=0}^{n} a_{v} z^{v}, a_{n} \neq 0$, is a polynomial of degree $n$ having all its zeros in $|z| \leq 1$, then

$$
\begin{equation*}
\max _{|z|=1}\left|p^{\prime}(z)\right| \geq \frac{n}{2}\left\{\max _{|z|=1}|p(z)|+\min _{|z|=1}|p(z)|\right\} . \tag{1.10}
\end{equation*}
$$

## 2. Lemmas

We will need the following lemmas.
Lemma 2.1. If $p(z)$ is a polynomial of degree $n$, having all its zeros in $|z| \leq 1$, then

$$
\begin{equation*}
\max _{|z|=1}\left|p^{\prime}(z)\right| \geq \frac{n}{2}\left\{\max _{|z|=1}|p(z)|+\min _{|z|=1}|p(z)|\right\} . \tag{2.1}
\end{equation*}
$$

The result is best possible and the equality holds for the polynomial $p(z)=(z+1)^{n}$.
The above result is due to Aziz and Dawood [1] (also see Govil [5, Theorem 2, inequality (1.7)]).

Lemma 2.2. If $p(z)=\sum_{v=0}^{n} a_{v} z^{v}$ is a polynomial of degree $n$, having no zeros on $|z|<1$, then for $R \geq 1$,

$$
\begin{align*}
\max _{|z|=R \geq 1}|p(z)| \leq & \left(\frac{R^{n}+1}{2}\right) \max _{|z|=1}|p(z)|-\left(\frac{R^{n}-1}{2}\right) \min _{|z|=1}|p(z)| \\
& -\left|a_{1}\right|\left(\frac{R^{n}-1}{n}-\frac{R^{n-2}-1}{n-2}\right), \quad \text { if } n>2,  \tag{2.2}\\
\max _{|z|=R \geq 1}|p(z)| \leq & \left(\frac{R^{n}+1}{2}\right) \max _{|z|=1}|p(z)|-\left(\frac{R^{n}-1}{2}\right) \min _{|z|=1}|p(z)|  \tag{2.3}\\
& -\left|a_{1}\right| \frac{(R-1)^{n}}{2}, \quad \text { if } n=2 .
\end{align*}
$$

The above result is a special case, with $s=1$ and $K=1$, of a result due to Govil [6, page 625].

4 On derivative and maximum modulus of a polynomial
Lemma 2.3. If $p(z)=\sum_{v=0}^{n} a_{v} z^{v}$ is a polynomial of degree $n, n \geq 1$, then for all $R \geq 1$,

$$
\begin{gather*}
\max _{|z|=R}|p(z)| \leq R^{n} \max _{|z|=1}|p(z)|-\left(R^{n}-R^{n-2}\right)|p(0)|, \quad \text { if } n \geq 2,  \tag{2.4}\\
\max _{|z|=R}|p(z)| \leq R \max _{|z|=1}|p(z)|-(R-1)|p(0)|, \quad \text { if } n=1 . \tag{2.5}
\end{gather*}
$$

The inequality (2.4) is due to Frappier et al. [2, Theorem 2], while (2.5) follows trivially.

## 3. Proof of the theorem

We first consider the case when $p(z)$ is degree $n>2$. Since $p(z)$ has all its zeros in $|z| \leq K$, $K \geq 1$, the polynomial $P(z)=p(K z)$ is of degree $n$, and has all its zeros in $|z| \leq 1$. Hence if we apply Lemma 2.1 to the polynomial $P(z)$, we will get

$$
\begin{equation*}
\max _{|z|=1}\left|P^{\prime}(z)\right| \geq \frac{n}{2}\left\{\max _{|z|=1}|P(z)|+\min _{|z|=1}|P(z)|\right\} \tag{3.1}
\end{equation*}
$$

which is equivalent to

$$
\begin{equation*}
K \max _{|z|=K}\left|p^{\prime}(z)\right| \geq \frac{n}{2}\left\{\max _{|z|=K}|p(z)|+\min _{|z|=K}|p(z)|\right\} . \tag{3.2}
\end{equation*}
$$

The polynomial $p(z)$ is of degree $n>2$, and so the polynomial $p^{\prime}(z)$ is of degree $n-$ 1 , where $n-1 \geq 2$, and hence applying Lemma 2.3 to the polynomial $p^{\prime}(z)$, we get for $K \geq 1$,

$$
\begin{equation*}
\max _{|z|=K}\left|p^{\prime}(z)\right| \leq K^{n-1} \max _{|z|=1}\left|p^{\prime}(z)\right|-\left(K^{n-1}-K^{n-3}\right)\left|a_{1}\right| . \tag{3.3}
\end{equation*}
$$

Combining (3.2) and (3.3), we get for $K \geq 1$,

$$
\begin{equation*}
K^{n-1} \max _{|z|=1}\left|p^{\prime}(z)\right|-\left(K^{n-1}-K^{n-3}\right)\left|a_{1}\right| \geq \frac{n}{2 K}\left\{\max _{|z|=K}|p(z)|+\min _{|z|=K}|p(z)|\right\} \tag{3.4}
\end{equation*}
$$

which is equivalent to

$$
\begin{equation*}
K^{n} \max _{|z|=1}\left|p^{\prime}(z)\right|-\left(K^{n}-K^{n-2}\right)\left|a_{1}\right| \geq \frac{n}{2}\left\{\max _{|z|=K}|p(z)|+\min _{|z|=K}|p(z)|\right\} . \tag{3.5}
\end{equation*}
$$

Since the polynomial $p(z)$ has all its zeros in $|z| \leq K, K \geq 1$, the polynomial $q(z)=$ $z^{n} p(1 / z)$ has no zeros in $|z|<1 / K$, hence the polynomial $q(z / K)$ is of degree $n>2$, and has no zeros in $|z|<1$. Therefore, on applying Lemma 2.2 to the polynomial $q(z / K)$, we get

$$
\begin{align*}
\max _{|z|=K \geq 1}|q(z / K)| \leq & \frac{K^{n}+1}{2} \max _{|z|=1}|q(z / K)|-\frac{K^{n}-1}{2} \min _{|z|=1}|q(z / K)| \\
& -\frac{\left|a_{n-1}\right|}{K}\left(\frac{K^{n}-1}{n}-\frac{K^{n-2}-1}{n-2}\right), \tag{3.6}
\end{align*}
$$

which is equivalent to

$$
\begin{align*}
\max _{|z|=1}|p(z)| \leq & \frac{K^{n}+1}{2 K^{n}} \max _{|z|=K}|p(z)|-\frac{K^{n}-1}{2 K^{n}} \min _{|z|=K}|p(z)|  \tag{3.7}\\
& -\frac{\left|a_{n-1}\right|}{K}\left(\frac{K^{n}-1}{n}-\frac{K^{n-2}-1}{n-2}\right) .
\end{align*}
$$

The above inequality easily gives

$$
\begin{align*}
\max _{|z|=K}|p(z)| \geq & \frac{2 K^{n}}{K^{n}+1} \max _{|z|=1}|p(z)|+\frac{K^{n}-1}{K^{n}+1} \min _{|z|=K}|p(z)| \\
& +\frac{2 K^{n-1}}{1+K^{n}}\left|a_{n-1}\right|\left(\frac{K^{n}-1}{n}-\frac{K^{n-2}-1}{n-2}\right), \tag{3.8}
\end{align*}
$$

and this when combined with (3.5) gives

$$
\begin{align*}
& \frac{2 K^{n}}{n} \max _{|z|=1}\left|p^{\prime}(z)\right|-\frac{2\left(K^{n}-K^{n-2}\right)}{n}\left|a_{1}\right|-\min _{|z|=K}|p(z)| \\
& \quad \geq \frac{2 K^{n}}{K^{n}+1} \max _{|z|=1}|p(z)|+\frac{K^{n}-1}{K^{n}+1} \min _{|z|=K}|p(z)|+\frac{2 K^{n-1}}{1+K^{n}}\left|a_{n-1}\right|\left(\frac{K^{n}-1}{n}-\frac{K^{n-2}-1}{n-2}\right) . \tag{3.9}
\end{align*}
$$

The above inequality (3.9) is clearly equivalent to

$$
\begin{align*}
\max _{|z|=1}\left|p^{\prime}(z)\right| \geq & \left|a_{1}\right|\left(1-\frac{1}{K^{2}}\right)+\frac{n}{K^{n}+1}\left(\max _{|z|=1}|p(z)|+\min _{|z|=K}|p(z)|\right) \\
& +\frac{n\left|a_{n-1}\right|}{K\left(1+K^{n}\right)}\left(\frac{K^{n}-1}{n}-\frac{K^{n-2}-1}{n-2}\right), \tag{3.10}
\end{align*}
$$

which is inequality (1.8), and thus our theorem, in the case $n>2$, is proved.
The proof of the theorem in the case $n=2$ follows on the same lines as above except that instead of inequalities (2.2) and (2.4), we use inequalities (2.3) and (2.5), respectively.
