#### Abstract

In this paper, we investigate a common fixed point problem of a finite family of asymptotically quasi- $\boldsymbol{\phi}$-nonexpansive mappings in the intermediate sense and an equilibrium problem. Strong convergence theorems of common solutions are established in a uniformly smooth and strictly convex Banach space which also enjoys the Kadec-Klee property.

MSC: 47H09; 47J25; 90C33
Keywords: asymptotically quasi- $\boldsymbol{\phi}$-nonexpansive mapping; asymptotically quasi- $\phi$-nonexpansive mapping in the intermediate sense; generalized projection; equilibrium problem; fixed point

## 1 Introduction-preliminaries

Let $E$ be a real Banach space. Recall that $E$ is said to be strictly convex if $\left\|\frac{x+y}{2}\right\|<1$ for all $x, y \in E$ with $\|x\|=\|y\|=1$ and $x \neq y$. It is said to be uniformly convex if $\lim _{n \rightarrow \infty}\left\|x_{n}-y_{n}\right\|=0$ for any two sequences $\left\{x_{n}\right\}$ and $\left\{y_{n}\right\}$ in $E$ such that $\left\|x_{n}\right\|=\left\|y_{n}\right\|=1$ and $\lim _{n \rightarrow \infty}\left\|\frac{x_{n}+y_{n}}{2}\right\|=1$. Let $U_{E}=\{x \in E:\|x\|=1\}$ be the unit sphere of $E$. Then the Banach space $E$ is said to be smooth if

$$
\lim _{t \rightarrow 0} \frac{\|x+t y\|-\|x\|}{t}
$$

exists for each $x, y \in U_{E}$. It is said to be uniformly smooth if the above limit is attained uniformly for $x, y \in U_{E}$.
Recall that $E$ has Kadec-Klee property if for any sequence $\left\{x_{n}\right\} \subset E$, and $x \in E$ with $x_{n} \rightharpoonup x$, and $\left\|x_{n}\right\| \rightarrow\|x\|$, then $\left\|x_{n}-x\right\| \rightarrow 0$ as $n \rightarrow \infty$. For more details of the KadecKlee property, the readers can refer to [1] and the references therein. It is well known that if $E$ is a uniformly convex Banach space, then $E$ enjoys the Kadec-Klee property.

Recall that the normalized duality mapping $J$ from $E$ to $2^{E^{*}}$ is defined by

$$
J x=\left\{f^{*} \in E^{*}:\left\langle x, f^{*}\right\rangle=\|x\|^{2}=\left\|f^{*}\right\|^{2}\right\}
$$

where $\langle\cdot, \cdot\rangle$ denotes the generalized duality pairing. It is well known that if $E$ is uniformly smooth, then $J$ is uniformly norm-to-norm continuous on each bounded subset of $E$. It is also well known that if $E$ is uniformly smooth if and only if $E^{*}$ is uniformly convex.

Next, we assume that $E$ is a smooth Banach space. Consider the functional defined by

$$
\phi(x, y)=\|x\|^{2}-2\langle x, J y\rangle+\|y\|^{2}, \quad \forall x, y \in E .
$$

Observe that, in a Hilbert space $H$, the equality is reduced to $\phi(x, y)=\|x-y\|^{2}, x, y \in H$. As we all know if $C$ is a nonempty closed convex subset of a Hilbert space $H$ and $P_{C}$ : $H \rightarrow C$ is the metric projection of $H$ onto $C$, then $P_{C}$ is nonexpansive. This fact actually characterizes Hilbert spaces and consequently, it is not available in more general Banach spaces. In this connection, Alber [2] recently introduced a generalized projection operator $\Pi_{C}$ in a Banach space $E$ which is an analog of the metric projection $P_{C}$ in Hilbert spaces. Recall that the generalized projection $\Pi_{C}: E \rightarrow C$ is a map that assigns to an arbitrary point $x \in E$ the minimum point of the functional $\phi(x, y)$, that is, $\Pi_{C} x=\bar{x}$, where $\bar{x}$ is the solution to the minimization problem

$$
\phi(\bar{x}, x)=\min _{y \in C} \phi(y, x) .
$$

The existence and uniqueness of the operator $\Pi_{C}$ follow from the properties of the functional $\phi(x, y)$ and strict monotonicity of the mapping $J$; see, for example, [1, 2]. In Hilbert spaces, $\Pi_{C}=P_{C}$. It is obvious from the definition of the function $\phi$ that

$$
\begin{equation*}
(\|x\|-\|y\|)^{2} \leq \phi(x, y) \leq(\|y\|+\|x\|)^{2}, \quad \forall x, y \in E, \tag{1.1}
\end{equation*}
$$

and

$$
\begin{equation*}
\phi(x, y)=\phi(x, z)+\phi(z, y)+2\langle x-z, J z-J y\rangle, \quad \forall x, y, z \in E . \tag{1.2}
\end{equation*}
$$

Remark 1.1 If $E$ is a reflexive, strictly convex, and smooth Banach space, then $\phi(x, y)=0$ if and only if $x=y$; for more details, see $[1,2]$ and the references therein.

Let $C$ be a nonempty subset of $E$ and let $T: C \rightarrow C$ be a mapping. In this paper, we use $F(T)$ to denote the fixed point set of $T . T$ is said to be asymptotically regular on $C$ if for any bounded subset $K$ of $C$,

$$
\limsup _{n \rightarrow \infty}\left\{\left\|T^{n+1} x-T^{n} x\right\|: x \in K\right\}=0 .
$$

$T$ is said to be closed if for any sequence $\left\{x_{n}\right\} \subset C$ such that $\lim _{n \rightarrow \infty} x_{n}=x_{0}$ and $\lim _{n \rightarrow \infty} T x_{n}=y_{0}$, then $T x_{0}=y_{0}$. In this paper, we use $\rightarrow$ and $\rightharpoonup$ to denote the strong convergence and weak convergence, respectively.

Recall that a point $p$ in $C$ is said to be an asymptotic fixed point of $T$ [3] iff $C$ contains a sequence $\left\{x_{n}\right\}$ which converges weakly to $p$ such that $\lim _{n \rightarrow \infty}\left\|x_{n}-T x_{n}\right\|=0$. The set of asymptotic fixed points of $T$ will be denoted by $\widetilde{F}(T)$.

A mapping $T$ is said to be relatively nonexpansive iff

$$
\widetilde{F}(T)=F(T) \neq \emptyset, \quad \phi(p, T x) \leq \phi(p, x), \quad \forall x \in C, \forall p \in F(T) .
$$

A mapping $T$ is said to be relatively asymptotically nonexpansive iff

$$
\widetilde{F}(T)=F(T) \neq \emptyset, \quad \phi\left(p, T^{n} x\right) \leq\left(1+\mu_{n}\right) \phi(p, x), \quad \forall x \in C, \forall p \in F(T), \forall n \geq 1,
$$

where $\left\{\mu_{n}\right\} \subset[0, \infty)$ is a sequence such that $\mu_{n} \rightarrow 0$ as $n \rightarrow \infty$.

Remark 1.2 The class of relatively asymptotically nonexpansive mappings were first considered in [4]; see also, [5] and the references therein.

Recall that a mapping $T$ is said to be quasi- $\phi$-nonexpansive iff

$$
F(T) \neq \emptyset, \quad \phi(p, T x) \leq \phi(p, x), \quad \forall x \in C, \forall p \in F(T) .
$$

Recall that a mapping $T$ is said to be asymptotically quasi- $\phi$-nonexpansive iff there exists a sequence $\left\{\mu_{n}\right\} \subset[0, \infty)$ with $\mu_{n} \rightarrow 0$ as $n \rightarrow \infty$ such that

$$
F(T) \neq \emptyset, \quad \phi\left(p, T^{n} x\right) \leq\left(1+\mu_{n}\right) \phi(p, x), \quad \forall x \in C, \forall p \in F(T), \forall n \geq 1 .
$$

Remark 1.3 The class of quasi- $\phi$-nonexpansive mappings was considered in [6]. The class of asymptotically quasi- $\phi$-nonexpansive mappings which was investigated in [7] and [8] includes the class of quasi- $\phi$-nonexpansive mappings as a special case.

Remark 1.4 The class of quasi- $\phi$-nonexpansive mappings and the class of asymptotically quasi- $\phi$-nonexpansive mappings are more general than the class of relatively nonexpansive mappings and the class of relatively asymptotically nonexpansive mappings. Quasi-$\phi$-nonexpansive mappings and asymptotically quasi- $\phi$-nonexpansive do not require the restriction $F(T)=\widetilde{F}(T)$.

Remark 1.5 The class of quasi- $\phi$-nonexpansive mappings and the class of asymptotically quasi- $\phi$-nonexpansive mappings are generalizations of the class of quasi-nonexpansive mappings and the class of asymptotically quasi-nonexpansive mappings in Banach spaces.

Recall that $T$ is said to be asymptotically quasi- $\phi$-nonexpansive in the intermediate sense iff $F(T) \neq \emptyset$ and the following inequality holds:

$$
\begin{equation*}
\limsup _{n \rightarrow \infty} \sup _{p \in F(T), x \in C}\left(\phi\left(p, T^{n} x\right)-\phi(p, x)\right) \leq 0 . \tag{1.3}
\end{equation*}
$$

Putting

$$
\xi_{n}=\max \left\{0, \sup _{p \in F(T), x \in C}\left(\phi\left(p, T^{n} x\right)-\phi(p, x)\right)\right\},
$$

it follows that $\xi_{n} \rightarrow 0$ as $n \rightarrow \infty$. Then (1.3) is reduced to the following:

$$
\begin{equation*}
\phi\left(p, T^{n} x\right) \leq \phi(p, x)+\xi_{n}, \quad \forall p \in F(T), \forall x \in C . \tag{1.4}
\end{equation*}
$$

Remark 1.6 The class of asymptotically quasi- $\phi$-nonexpansive mappings in the intermediate sense was first considered by Qin and Wang [9].

Remark 1.7 The class of asymptotically quasi- $\phi$-nonexpansive mappings in the intermediate sense is a generalization of the class of asymptotically quasi-nonexpansive mappings in the intermediate sense, which was considered by Kirk [10], in the framework of Banach spaces.

Let $f$ be a bifunction from $C \times C$ to $\mathbb{R}$, where $\mathbb{R}$ denotes the set of real numbers. Recall the following equilibrium problem. Find $p \in C$ such that

$$
\begin{equation*}
f(p, y) \geq 0, \quad \forall y \in C \tag{1.5}
\end{equation*}
$$

We use $E P(f)$ to denote the solution set of the equilibrium problem (1.5). That is,

$$
E P(f)=\{p \in C: f(p, y) \geq 0, \forall y \in C\} .
$$

We remark here that the equilibrium problem was first introduced by Fan [11]. Given a mapping $Q: C \rightarrow E^{*}$, let

$$
f(x, y)=\langle Q x, y-x\rangle, \quad \forall x, y \in C .
$$

Then $p \in E P(f)$ if and only if $p$ is a solution of the following variational inequality. Find $p$ such that

$$
\begin{equation*}
\langle Q p, y-p\rangle \geq 0, \quad \forall y \in C . \tag{1.6}
\end{equation*}
$$

To study the equilibrium problems (1.5), we may assume that $F$ satisfies the following conditions:
(A1) $F(x, x)=0$ for all $x \in C$;
(A2) $F$ is monotone, i.e., $F(x, y)+F(y, x) \leq 0$ for all $x, y \in C$;
(A3) for each $x, y, z \in C$,

$$
\limsup _{t \downarrow 0} F(t z+(1-t) x, y) \leq F(x, y) ;
$$

(A4) for each $x \in C, y \mapsto F(x, y)$ is convex and weakly lower semi-continuous.
Numerous problems in physics, optimization, and economics reduce to find a solution of (1.5). Recently, many authors have investigated common solutions of fixed point and equilibrium problems in Banach spaces; see, for example, [12-33] and the references therein.

In this paper, we consider a projection algorithm for treating the equilibrium problem and fixed point problems of asymptotically quasi- $\phi$-nonexpansive mappings in the intermediate sense.
In order to prove our main results, we need the following lemmas.

Lemma 1.8 [2] Let E be a reflexive, strictly convex and smooth Banach space. Let C be a nonempty closed convex subset of $E$ and let $x \in E$. Then

$$
\phi\left(y, \Pi_{C} x\right)+\phi\left(\Pi_{C} x, x\right) \leq \phi(y, x), \quad \forall y \in C .
$$

Lemma 1.9 [2] Let C be a nonempty closed convex subset of a smooth Banach space $E$ and let $x \in E$. Then $x_{0}=\Pi_{C} x$ if and only if

$$
\left\langle x_{0}-y, J x-J x_{0}\right\rangle \geq 0, \quad \forall y \in C .
$$

Lemma 1.10 Let $C$ be a closed convex subset of a smooth, strictly convex and reflexive Banach space E. Letf be a bifunction from $C \times C$ to $\mathbb{R}$ satisfying (A1)-(A4). Let $r>0$ and $x \in E$. Then
(a) [34] There exists $z \in C$ such that

$$
f(z, y)+\frac{1}{r}\langle y-z, J z-J x\rangle \geq 0, \quad \forall y \in C .
$$

(b) $[6,24]$ Define a mapping $T_{r}: E \rightarrow C$ by

$$
S_{r} x=\left\{z \in C: f(z, y)+\frac{1}{r}\langle y-z, J z-J x\rangle, \forall y \in C\right\} .
$$

Then the following conclusions hold:
(1) $S_{r}$ is single-valued;
(2) $S_{r}$ is a firmly nonexpansive-type mapping, i.e., for all $x, y \in E$,

$$
\left\langle S_{r} x-S_{r} y, J S_{r} x-J S_{r} y\right\rangle \leq\left\langle S_{r} x-S_{r} y, J x-J y\right\rangle
$$

(3) $F\left(S_{r}\right)=E P(f)$;
(4) $S_{r}$ is quasi- $\phi$-nonexpansive;
(5) $\phi\left(q, S_{r} x\right)+\phi\left(S_{r} x, x\right) \leq \phi(q, x), \forall q \in F\left(S_{r}\right)$;
(6) $E P(f)$ is closed and convex.

Lemma 1.11 [35] Let E be a smooth and uniformly convex Banach space and let $r>0$. Then there exists a strictly increasing, continuous and convex function $g:[0,2 r] \rightarrow R$ such that $g(0)=0$ and

$$
\|t x+(1-t) y\|^{2} \leq t\|x\|^{2}+(1-t)\|y\|^{2}-t(1-t) g(\|x-y\|)
$$

for all $x, y \in B_{r}=\{x \in E:\|x\| \leq r\}$ and $t \in[0,1]$.

## 2 Main results

Theorem 2.1 Let E be a uniformly smooth and strictly convex Banach space which also enjoys the Kadec-Klee property and let C be a nonempty closed and convex subset of E. Letf be a bifunction from $C \times C$ to $\mathbb{R}$ satisfying (A1)-(A4) and let $N$ be some positive integer. Let $T_{i}: C \rightarrow C$ an asymptotically quasi- $\phi$-nonexpansive mapping in the intermediate sense for every $1 \leq i \leq N$. Assume that $T_{i}$ is closed asymptotically regular on $C$ and $\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap$
$E F(f)$ is nonempty and bounded. Let $\left\{x_{n}\right\}$ be a sequence generated in the following manner:

$$
\left\{\begin{array}{l}
x_{0} \in E \text { chosen arbitrarily, } \\
C_{1}=C, \\
x_{1}=\Pi_{C_{1}} x_{0}, \\
y_{n}=J^{-1}\left(\alpha_{n, 0} J x_{n}+\sum_{i=1}^{N} \alpha_{n, j} J T_{i}^{n} x_{n}\right), \\
u_{n} \in C \text { such that } f\left(u_{n}, y\right)+\frac{1}{r_{n}}\left\langle y-u_{n}, J_{n}-J y_{n}\right\rangle \geq 0, \quad \forall y \in C, \\
C_{n+1}=\left\{z \in C_{n}: \phi\left(z, u_{n}\right) \leq \phi\left(z, x_{n}\right)+\xi_{n}\right\}, \\
x_{n+1}=\Pi_{C_{n+1}} x_{0},
\end{array}\right.
$$

where $\xi_{n}=\max \left\{0, \sup _{p \in F\left(T_{i}\right), x \in C}\left(\phi\left(p, T_{i}^{n} x\right)-\phi(p, x)\right)\right\},\left\{\alpha_{n, i}\right\}$ is a real number sequence in $(0,1)$ for every $1 \leq i \leq N,\left\{r_{n}\right\}$ is a real number sequence in $[k, \infty)$, where $k$ is some positive real number. Assume that $\sum_{i=0}^{N} \alpha_{n, i}=1$ and $\liminf _{n \rightarrow \infty} \alpha_{n, 0} \alpha_{n, i}>0$ for every $1 \leq i \leq N$. Then the sequence $\left\{x_{n}\right\}$ converges strongly to $\Pi_{\Pi_{i=1}^{N} F\left(T_{i}\right) \cap E F(f)} x_{1}$, where $\Pi_{\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f)}$ is the generalized projection from E onto $\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f)$.

Proof First, we show that $\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f)$ is closed and convex. From [9], we find that $\bigcap_{i=1}^{N} F\left(T_{i}\right)$ is closed and convex, which combines with Lemma 1.10 shows that $\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap$ $E F(f)$ is closed and convex. Next, we show that $C_{n}$ is closed and convex. It is obvious that $C_{1}=C$ is closed and convex. Suppose that $C_{h}$ is closed and convex for some positive integer $h$. For $z \in C_{h}$, we see that $\phi\left(z, u_{h}\right) \leq \phi\left(z, x_{h}\right)+\xi_{h}$ is equivalent to

$$
2\left\langle z, J x_{h}-J u_{h}\right\rangle \leq\left\|x_{k}\right\|^{2}-\left\|u_{k}\right\|^{2}+\xi_{h} .
$$

It is to see that $C_{h+1}$ is closed and convex. This proves that $C_{n}$ is closed and convex. This in turn shows that $\Pi_{C_{n+1}} x_{1}$ is well defined. Putting $u_{n}=S_{r_{n}} y_{n}$, we from Lemma 1.10 see that $S_{r_{n}}$ is quasi- $\phi$-nonexpansive. Now, we are in a position to prove that $\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f) \subset C_{n}$. Indeed, $\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f) \subset C_{1}=C$ is obvious. Assume that $\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f) \subset C_{h}$ for some positive integer $h$. Then, for $\forall w \in \bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f) \subset C_{h}$, we have

$$
\begin{aligned}
\phi\left(w, u_{h}\right) & =\phi\left(w, S_{r_{h}} y_{h}\right) \\
& \leq \phi\left(w, y_{h}\right) \\
& =\phi\left(w, J^{-1}\left(\alpha_{h, 0} J x_{h}+\sum_{i=1}^{N} \alpha_{h, J} J T_{i}^{h} x_{h}\right)\right) \\
& =\|w\|^{2}-2\left\langle w, \alpha_{h, 0} J x_{h}+\sum_{i=1}^{N} \alpha_{h, j} J T_{i}^{h} x_{h}\right\rangle+\left\|\alpha_{h, 0} \mid x_{h}+\sum_{i=1}^{N} \alpha_{h, j} J T_{i}^{h} x_{h}\right\|^{2} \\
& \leq\|w\|^{2}-2 \alpha_{h, 0}\left\langle w, J x_{h}\right\rangle-2 \sum_{i=1}^{N} \alpha_{h, i}\left|w, J T_{i}^{h} x_{h}\right\rangle+\alpha_{h, 0}\left\|x_{h}\right\|^{2}+\sum_{i=1}^{N} \alpha_{h, i}\left\|T_{i}^{h} x_{h}\right\|^{2} \\
& =\alpha_{h, 0} \phi\left(w, x_{h}\right)+\sum_{i=1}^{N} \alpha_{h, i} \phi\left(w, T_{i}^{h} x_{h}\right) \\
& \leq \alpha_{h, 0} \phi\left(w, x_{h}\right)+\sum_{i=1}^{N} \alpha_{h, i} \phi\left(w, x_{h}\right)+\sum_{i=1}^{N} \alpha_{h, i} \xi_{h}
\end{aligned}
$$

$$
\begin{align*}
& =\phi\left(w, x_{h}\right)+\sum_{i=1}^{N} \alpha_{h, i} \xi_{h} \\
& \leq \phi\left(w, x_{h}\right)+\sum_{i=1}^{N} \xi_{h} \tag{2.1}
\end{align*}
$$

which shows that $w \in C_{h+1}$. This implies that $\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f) \subset C_{n}$.
Next, we prove that the sequence $\left\{x_{n}\right\}$ is bounded. Notice that $x_{n}=\Pi_{C_{n}} x_{1}$. We find from Lemma 1.9 that $\left\langle x_{n}-z, J x_{1}-J x_{n}\right\rangle \geq 0$, for any $z \in C_{n}$. Since $\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f) \subset C_{n}$, we find that

$$
\begin{equation*}
\left\langle x_{n}-w, J x_{1}-J x_{n}\right\rangle \geq 0, \quad \forall w \in \bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f) . \tag{2.2}
\end{equation*}
$$

It follows from Lemma 1.8 that

$$
\begin{aligned}
\phi\left(x_{n}, x_{1}\right) & \leq \phi\left(\Pi_{\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f)} x_{1}, x_{1}\right)-\phi\left(\Pi_{\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f)^{x_{1}}, x_{n}}\right) \\
& \leq \phi\left(\Pi_{\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f)} x_{1}, x_{1}\right) .
\end{aligned}
$$

This implies that the sequence $\left\{\phi\left(x_{n}, x_{1}\right)\right\}$ is bounded. It follows from (1.1) that the sequence $\left\{x_{n}\right\}$ is also bounded. Since the space is reflexive, we may assume, without loss of generality, that $x_{n} \rightharpoonup \bar{x}$. Next, we prove that $\bar{x} \in \bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f)$. Since $C_{n}$ is closed and convex, we find that $\bar{x} \in C_{n}$. This implies from $x_{n}=\Pi_{C_{n}} x_{1}$ that $\phi\left(x_{n}, x_{1}\right) \leq \phi\left(\bar{x}, x_{1}\right)$. On the other hand, we see from the weakly lower semicontinuity of $\|\cdot\|$ that

$$
\begin{aligned}
\phi\left(\bar{x}, x_{1}\right) & =\|\bar{x}\|^{2}-2\left\langle\bar{x}, J x_{1}\right\rangle+\left\|x_{1}\right\|^{2} \\
& \leq \liminf _{n \rightarrow \infty}\left(\left\|x_{n}\right\|^{2}-2\left\langle x_{n}, J x_{1}\right\rangle+\left\|x_{1}\right\|^{2}\right) \\
& =\liminf _{n \rightarrow \infty} \phi\left(x_{n}, x_{1}\right) \\
& \leq \limsup _{n \rightarrow \infty} \phi\left(x_{n}, x_{1}\right) \\
& \leq \phi\left(\bar{x}, x_{1}\right),
\end{aligned}
$$

which implies that $\lim _{n \rightarrow \infty} \phi\left(x_{n}, x_{1}\right)=\phi\left(\bar{x}, x_{1}\right)$. Hence, we have $\lim _{n \rightarrow \infty}\left\|x_{n}\right\|=\|\bar{x}\|$. In view of the Kadec-Klee property of $E$, we find that $x_{n} \rightarrow \bar{x}$ as $n \rightarrow \infty$. Since $x_{n}=\Pi_{C_{n}} x_{1}$, and $x_{n+1}=\Pi_{C_{n+1}} x_{1} \in C_{n+1} \subset C_{n}$, we find that $\phi\left(x_{n}, x_{1}\right) \leq \phi\left(x_{n+1}, x_{1}\right)$. This shows that $\left\{\phi\left(x_{n}, x_{1}\right)\right\}$ is nondecreasing. We find from its boundedness that $\lim _{n \rightarrow \infty} \phi\left(x_{n}, x_{1}\right)$ exists. It follows that

$$
\begin{aligned}
\phi\left(x_{n+1}, x_{n}\right) & =\phi\left(x_{n+1}, \Pi_{C_{n}} x_{1}\right) \\
& \leq \phi\left(x_{n+1}, x_{1}\right)-\phi\left(\Pi_{C_{n}} x_{1}, x_{1}\right) \\
& =\phi\left(x_{n+1}, x_{1}\right)-\phi\left(x_{n}, x_{1}\right) .
\end{aligned}
$$

This implies that

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \phi\left(x_{n+1}, x_{n}\right)=0 . \tag{2.3}
\end{equation*}
$$

In the light of $x_{n+1}=\Pi_{C_{n+1}} x_{1} \in C_{n+1}$, we find that

$$
\phi\left(x_{n+1}, u_{n}\right) \leq \phi\left(x_{n+1}, x_{n}\right)+\xi_{n} .
$$

It follows from (2.3) that

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \phi\left(x_{n+1}, u_{n}\right)=0 \tag{2.4}
\end{equation*}
$$

In view of (1.1), we see that $\lim _{n \rightarrow \infty}\left(\left\|x_{n+1}\right\|-\left\|u_{n}\right\|\right)=0$. This implies that $\lim _{n \rightarrow \infty}\left\|u_{n}\right\|=$ $\|\bar{x}\|$. That is,

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|J u_{n}\right\|=\lim _{n \rightarrow \infty}\left\|u_{n}\right\|=\|J \bar{x}\| . \tag{2.5}
\end{equation*}
$$

This implies that $\left\{J u_{n}\right\}$ is bounded. Note that both $E$ and $E^{*}$ are reflexive. We may assume, without loss of generality, that $J u_{n} \rightharpoonup u^{*} \in E^{*}$. In view of the reflexivity of $E$, we see that $J(E)=E^{*}$. This shows that there exists an element $u \in E$ such that $J u=u^{*}$. It follows that

$$
\begin{aligned}
\phi\left(x_{n+1}, u_{n}\right) & =\left\|x_{n+1}\right\|^{2}-2\left\langle x_{n+1}, J u_{n}\right\rangle+\left\|u_{n}\right\|^{2} \\
& =\left\|x_{n+1}\right\|^{2}-2\left\langle x_{n+1}, J u_{n}\right\rangle+\left\|J u_{n}\right\|^{2} .
\end{aligned}
$$

Taking $\liminf _{n \rightarrow \infty}$ on both sides of the equality aboven yields

$$
\begin{aligned}
0 & \geq\|\bar{x}\|^{2}-2\left\langle\bar{x}, u^{*}\right\rangle+\left\|u^{*}\right\|^{2} \\
& =\|\bar{x}\|^{2}-2\langle\bar{x}, J u\rangle+\|J u\|^{2} \\
& =\|\bar{x}\|^{2}-2\langle\bar{x}, J u\rangle+\|u\|^{2} \\
& =\phi(\bar{x}, u) .
\end{aligned}
$$

That is, $\bar{x}=u$, which in turn implies that $u^{*}=J \bar{x}$. It follows that $J u_{n} \rightharpoonup J \bar{x} \in E^{*}$. Since $E^{*}$ enjoys the Kadec-Klee property, we obtain from (2.5) that $\lim _{n \rightarrow \infty} J u_{n}=J \bar{x}$. Since $J^{-1}$ : $E^{*} \rightarrow E$ is demicontinuous and $E$ enjoys the Kadec-Klee property, we obtain $u_{n} \rightarrow \bar{x}$, as $n \rightarrow \infty$. Note that

$$
\left\|x_{n}-u_{n}\right\| \leq\left\|x_{n}-\bar{x}\right\|+\left\|\bar{x}-u_{n}\right\| .
$$

It follows that

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|x_{n}-u_{n}\right\|=0 \tag{2.6}
\end{equation*}
$$

Since $J$ is uniformly norm-to-norm continuous on any bounded sets, we have

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|J x_{n}-J u_{n}\right\|=0 \tag{2.7}
\end{equation*}
$$

On the other hand, we have

$$
\begin{aligned}
\phi\left(w, x_{n}\right)-\phi\left(w, u_{n}\right) & =\left\|x_{n}\right\|^{2}-\left\|u_{n}\right\|^{2}-2\left\langle w, J x_{n}-J u_{n}\right\rangle \\
& \leq\left\|x_{n}-u_{n}\right\|\left(\left\|x_{n}\right\|+\left\|u_{n}\right\|\right)+2\|w\|\left\|J x_{n}-J u_{n}\right\| .
\end{aligned}
$$

We, therefore, find that

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left(\phi\left(w, x_{n}\right)-\phi\left(w, u_{n}\right)\right)=0 . \tag{2.8}
\end{equation*}
$$

Since $E$ is uniformly smooth, we know that $E^{*}$ is uniformly convex. In view of Lemma 1.11, we find that

$$
\begin{aligned}
\phi\left(w, u_{n}\right) & =\phi\left(w, S_{r_{n}} y_{n}\right) \\
& \leq \phi\left(w, y_{n}\right) \\
& =\phi\left(w, J^{-1}\left(\alpha_{n, 0} J x_{n}+\sum_{i=1}^{N} \alpha_{n, i} J T_{i}^{n} x_{n}\right)\right) \\
& =\|w\|^{2}-2\left(w, \alpha_{n, 0} J x_{n}+\sum_{i=1}^{N} \alpha_{n, i} J T_{i}^{n} x_{n}\right\rangle+\left\|\alpha_{n, 0} J x_{n}+\sum_{i=1}^{N} \alpha_{n, i} J T_{i}^{n} x_{n}\right\|^{2} \\
& \leq\|w\|^{2}-2 \alpha_{n, 0}\left\langle w, J x_{n}\right\rangle-2 \sum_{i=1}^{N} \alpha_{n, i}\left\langle w, J T_{i}^{n} x_{n}\right\rangle+\alpha_{n, 0}\left\|x_{n}\right\|^{2}+\sum_{i=1}^{N} \alpha_{n, i}\left\|T_{i}^{n} x_{n}\right\|^{2} \\
& -\alpha_{n, 0} \alpha_{n, 1} g\left(\left\|J x_{n}-J T_{1}^{n} x_{n}\right\|\right) \\
& =\alpha_{n, 0} \phi\left(w, x_{n}\right)+\sum_{i=1}^{N} \alpha_{n, i} \phi\left(w, T_{i}^{n} x_{n}\right)-\alpha_{n, 0} \alpha_{n, 1} g\left(\left\|J x_{n}-J T_{1}^{n} x_{n}\right\|\right) \\
& \leq \alpha_{n, 0} \phi\left(w, x_{n}\right)+\sum_{i=1}^{N} \alpha_{n, i} \phi\left(w, x_{n}\right)+\sum_{i=1}^{N} \alpha_{n, i} \xi_{h} \\
& -\alpha_{n, 0} \alpha_{n, 1} g\left(\left\|J x_{n}-J T_{1}^{n} x_{n}\right\|\right) \\
& =\phi\left(w, x_{n}\right)+\sum_{i=1}^{N} \alpha_{n, i} \xi_{n}-\alpha_{n, 0} \alpha_{n, 1} g\left(\left\|J x_{n}-J T_{1}^{n} x_{n}\right\|\right) \\
& \leq \phi\left(w, x_{n}\right)+\xi_{n}-\alpha_{n, 0} \alpha_{n, 1} g\left(\left\|J x_{n}-J T_{1}^{n} x_{n}\right\|\right) .
\end{aligned}
$$

It follows that

$$
\alpha_{n, 0} \alpha_{n, 1} g\left(\left\|J x_{n}-J T_{1}^{n} x_{n}\right\|\right) \leq \phi\left(w, x_{n}\right)-\phi\left(w, u_{n}\right)+\xi_{n} .
$$

In view of the restriction on the sequences, we find from (2.8) that $\lim _{n \rightarrow \infty} g\left(\| J x_{n}-\right.$ $\left.J T_{1}^{n} x_{n} \|\right)=0$. It follows that

$$
\lim _{n \rightarrow \infty}\left\|J x_{n}-J T_{1}^{n} x_{n}\right\|=0
$$

In the same way, we obtain

$$
\lim _{n \rightarrow \infty}\left\|J x_{n}-J T_{i}^{n} x_{n}\right\|=0, \quad \forall 1 \leq i \leq N
$$

Notice that $\left\|J T_{i}^{n} x_{n}-J \bar{x}\right\| \leq\left\|J T_{i}^{n} x_{n}-J x_{n}\right\|+\left\|J x_{n}-J \bar{x}\right\|$. It follows that

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|J T_{i}^{n} x_{n}-J \bar{x}\right\|=0 \tag{2.9}
\end{equation*}
$$

The demicontinuity of $J^{-1}: E^{*} \rightarrow E$ implies that $T_{i}^{n} x_{n} \rightharpoonup \bar{x}$. Note that

$$
\left|\left\|T_{i}^{n} x_{n}\right\|-\|\bar{x}\|\right|=\left|\left\|J T_{i}^{n} x_{n}\right\|-\|J \bar{x}\|\right| \leq\left\|J T_{i}^{n} x_{n}-J \bar{x}\right\| .
$$

This implies from (2.9) that $\lim _{n \rightarrow \infty}\left\|T_{i}^{n} x_{n}\right\|=\|\bar{x}\|$. Since $E$ has the Kadec-Klee property, we obtain $\lim _{n \rightarrow \infty}\left\|T_{i}^{n} x_{n}-\bar{x}\right\|=0$. On the other hand, we have

$$
\left\|T_{i}^{n+1} x_{n}-\bar{x}\right\| \leq\left\|T_{i}^{n+1} x_{n}-T_{i}^{n} x_{n}\right\|+\left\|T_{i}^{n} x_{n}-\bar{x}\right\| .
$$

It follows from the uniformly asymptotic regularity of $T_{i}$ that

$$
\lim _{n \rightarrow \infty}\left\|T_{i}^{n+1} x_{n}-\bar{x}\right\|=0
$$

That is, $T_{i} T_{i}^{n} x_{n} \rightarrow \bar{x}$. From the closedness of $T_{i}$, we find $\bar{x}=T_{i} \bar{x}$ for every $1 \leq i \leq N$. This proves $\bar{x} \in \bigcap_{i=1}^{N} F\left(T_{i}\right)$.
Next, we show that $\bar{x} \in E F(f)$. In view of Lemma 1.8, we find that

$$
\begin{aligned}
\phi\left(u_{n}, y_{n}\right) & \leq \phi\left(w, y_{n}\right)-\phi\left(w, u_{n}\right) \\
& \leq \phi\left(w, x_{n}\right)+\mu_{n}-\phi\left(w, u_{n}\right) .
\end{aligned}
$$

It follows from (2.8) that $\lim _{n \rightarrow \infty} \phi\left(u_{n}, y_{n}\right)=0$. This implies that $\lim _{n \rightarrow \infty}\left(\left\|u_{n}\right\|-\left\|y_{n}\right\|\right)=0$. It follows from (2.6) that

$$
\lim _{n \rightarrow \infty}\left\|y_{n}\right\|=\|\bar{x}\| .
$$

It follows that

$$
\lim _{n \rightarrow \infty}\left\|J y_{n}\right\|=\lim _{n \rightarrow \infty}\left\|y_{n}\right\|=\|\bar{x}\|=\|J \bar{x}\| .
$$

This shows that $\left\{J y_{n}\right\}$ is bounded. Since $E^{*}$ is reflexive, we may assume that $J y_{n} \rightharpoonup v^{*} \in E^{*}$. In view of $J(E)=E^{*}$, we see that there exists $v \in E$ such that $J v=v^{*}$. It follows that

$$
\begin{aligned}
\phi\left(u_{n}, y_{n}\right) & =\left\|u_{n}\right\|^{2}-2\left\langle u_{n}, J y_{n}\right\rangle+\left\|y_{n}\right\|^{2} \\
& =\left\|u_{n}\right\|^{2}-2\left\langle u_{n}, J y_{n}\right\rangle+\left\|y_{n}\right\|^{2} .
\end{aligned}
$$

Taking $\liminf _{n \rightarrow \infty}$ the both sides of equality above yields that

$$
\begin{aligned}
0 & \geq\|\bar{x}\|^{2}-2\left\langle\bar{x}, v^{*}\right\rangle+\left\|v^{*}\right\|^{2} \\
& =\|\bar{x}\|^{2}-2\langle\bar{x}, J v\rangle+\|J v\|^{2} \\
& =\|\bar{x}\|^{2}-2\langle\bar{x}, J v\rangle+\|v\|^{2} \\
& =\phi(\bar{x}, v) .
\end{aligned}
$$

That is, $\bar{x}=v$, which in turn implies that $v^{*}=J \bar{x}$. It follows that $J y_{n} \rightharpoonup J \bar{x} \in E^{*}$. Since $E^{*}$ enjoys the Kadec-Klee property, we obtain $J y_{n}-J \bar{x} \rightarrow 0$ as $n \rightarrow \infty$. Note that $J^{-1}: E^{*} \rightarrow E$
is demicontinuous. It follows that $y_{n} \rightharpoonup \bar{x}$. Since $E$ enjoys the Kadec-Klee property, we obtain $y_{n} \rightarrow \bar{x}$ as $n \rightarrow \infty$. Note that

$$
\left\|u_{n}-y_{n}\right\| \leq\left\|u_{n}-\bar{x}\right\|+\left\|\bar{x}-y_{n}\right\| .
$$

This implies that $\lim _{n \rightarrow \infty}\left\|u_{n}-y_{n}\right\|=0$. Since $J$ is uniformly norm-to-norm continuous on any bounded sets, we have $\lim _{n \rightarrow \infty}\left\|J u_{n}-J y_{n}\right\|=0$. From the assumption $r_{n} \geq k$, we see that

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \frac{\left\|J u_{n}-J y_{n}\right\|}{r_{n}}=0 . \tag{2.10}
\end{equation*}
$$

Since $u_{n}=S_{r_{n}} y_{n}$, we find that

$$
f\left(u_{n}, y\right)+\frac{1}{r_{n}}\left\langle y-u_{n}, J u_{n}-J y_{n}\right\rangle \geq 0, \quad \forall y \in C .
$$

It follows from (A2) that

$$
\left\|y-u_{n}\right\| \frac{\left\|J u_{n}-J y_{n}\right\|}{r_{n}} \geq \frac{1}{r_{n}}\left\langle y-u_{n}, J u_{n}-J y_{n}\right\rangle \geq f\left(y, u_{n}\right), \quad \forall y \in C .
$$

In view of (A4), we find from (2.10) that

$$
f(y, \bar{x}) \leq 0, \quad \forall y \in C .
$$

For $0<t<1$ and $y \in C$, define $y_{t}=t y+(1-t) \bar{x}$. It follows that $y_{t} \in C$, which yields $f\left(y_{t}, \bar{x}\right) \leq 0$. It follows from (A1) and (A4) that

$$
0=f\left(y_{t}, y_{t}\right) \leq t f\left(y_{t}, y\right)+(1-t) f\left(y_{t}, \bar{x}\right) \leq t f\left(y_{t}, y\right) .
$$

That is,

$$
f\left(y_{t}, y\right) \geq 0 .
$$

Letting $t \downarrow 0$, we obtain from (A3) that $f(\bar{x}, y) \geq 0, \forall y \in C$. This implies that $\bar{x} \in E P(f)$.
Finally, we turn our attention to proving that $\bar{x}=\Pi_{\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f)}{ }^{x_{1}}$.
Letting $n \rightarrow \infty$ in (2.2), we obtain

$$
\left\langle\bar{x}-w, J x_{1}-J \bar{x}\right\rangle \geq 0, \quad \forall w \in \bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f) .
$$

In view of Lemma 1.9, we find that $\bar{x}=\Pi_{\bigcap_{i=1}^{N} F\left(T_{i}\right) \cap E F(f)} x_{1}$. This completes the proof.
From the definition of quasi- $\phi$-nonexpansive mappings, we see that every quasi- $\phi$ nonexpansive mapping is asymptotically quasi- $\phi$-nonexpansive in the intermediate sense. We also know that every uniformly smooth and uniformly convex space is a uniformly smooth and strictly convex Banach space which also enjoys the Kadec-Klee property (note that every uniformly convex Banach space enjoys the Kadec-Klee property).

Remark 2.2 Theorem 2.1 can be viewed an extension of the corresponding results in Qin et al. [6], Kim [12], Qin et al. [22], Takahashi and Zembayashi [24], respectively. The space $L^{p}$, where $p>1$, satisfies the restriction in Theorem 2.1.

## 3 Applications

Theorem 3.1 Let E be a uniformly smooth and strictly convex Banach space which also enjoys the Kadec-Klee property and let C be a nonempty closed and convex subset of E. Let $f$ be a bifunction from $C \times C$ to $\mathbb{R}$ satisfying (A1)-(A4). Let $T: C \rightarrow C$ an asymptotically quasi- $\phi$-nonexpansive mapping in the intermediate sense. Assume that $T$ is closed asymptotically regular on $C$ and $F(T) \cap E F(f)$ is nonempty and bounded. Let $\left\{x_{n}\right\}$ be a sequence generated in the following manner:

$$
\left\{\begin{array}{l}
x_{0} \in E \text { chosen arbitrarily }, \\
C_{1}=C \\
x_{1}=\Pi_{C_{1}} x_{0} \\
y_{n}=J^{-1}\left(\alpha_{n, 0} J x_{n}+\alpha_{n, 1} J T^{n} x_{n}\right), \\
u_{n} \in C \text { such that } f\left(u_{n}, y\right)+\frac{1}{r_{n}}\left\langle y-u_{n}, J u_{n}-J y_{n}\right\rangle \geq 0, \quad \forall y \in C, \\
C_{n+1}=\left\{z \in C_{n}: \phi\left(z, u_{n}\right) \leq \phi\left(z, x_{n}\right)+\xi_{n}\right\}, \\
x_{n+1}=\Pi_{C_{n+1}} x_{0}
\end{array}\right.
$$

where $\xi_{n}=\max \left\{0, \sup _{p \in F(T), x \in C}\left(\phi\left(p, T^{n} x\right)-\phi(p, x)\right)\right\},\left\{r_{n}\right\}$ is a real number sequence in $[k, \infty)$, where $k$ is some positive real number, $\left\{\alpha_{n, 0}\right\}$ and $\left\{\alpha_{n} n, 1\right\}$ are two real number sequence in $(0,1)$. Assume that $\liminf _{n \rightarrow \infty} \alpha_{n, 0} \alpha_{n, 1}>0$. Then the sequence $\left\{x_{n}\right\}$ converges strongly to $\Pi_{F(T) \cap E F(f)} x_{1}$, where $\Pi_{F(T) \cap E F(f)}$ is the generalized projection from $E$ onto $F(T) \cap E F(f)$.

Proof Putting $N=1$, we draw from Theorem 2.1 the desired conclusion immediately.

Remark 3.2 If the mapping $T$ in Theorem 3.1 is quasi- $\phi$-nonexpansive, then the restrictions that $T$ is closed asymptotically regular on $C$ and $F(T) \cap E F(f)$ is bounded will not be required anymore.

If $T_{i}=I$, where $I$ is the identity for every $1 \leq i \leq N$, then we find from Theorem 2.1 the following.

Theorem 3.3 Let E be a uniformly smooth and strictly convex Banach space which also enjoys the Kadec-Klee property and let C be a nonempty closed and convex subset of E. Let $f$ be a bifunction from $C \times C$ to $\mathbb{R}$ satisfying (A1)-(A4). Assume that $E F(f)$ is nonempty. Let
$\left\{x_{n}\right\}$ be a sequence generated in the following manner:

$$
\left\{\begin{array}{l}
x_{0} \in E \text { chosen arbitrarily, } \\
C_{1}=C, \\
x_{1}=\Pi_{C_{1}} x_{0}, \\
u_{n} \in C \text { such that } f\left(u_{n}, y\right)+\frac{1}{r_{n}}\left\langle y-u_{n}, J u_{n}-J x_{n}\right\rangle \geq 0, \quad \forall y \in C, \\
C_{n+1}=\left\{z \in C_{n}: \phi\left(z, u_{n}\right) \leq \phi\left(z, x_{n}\right)\right\}, \\
x_{n+1}=\Pi_{C_{n+1}} x_{0},
\end{array}\right.
$$

where $\left\{r_{n}\right\}$ is a real number sequence in $[k, \infty)$, where $k$ is some positive real number. Then the sequence $\left\{x_{n}\right\}$ converges strongly to $\Pi_{E F(f)} x_{1}$, where $\Pi_{E F(f)}$ is the generalized projection from $E$ onto $E F(f)$.
