#### Abstract

In this paper, the modular-type operator norm of the general geometric mean operator over spherical cones is investigated. We give two applications of a new limit process, introduced by the present authors, to the establishment of Pólya-Knopp-type inequalities. We not only partially generalize the sufficient parts of Persson-Stepanov's and Wedestig's results, but we also provide new proofs to these results.

MSC: 47A30; 26D10; 26D15
Keywords: operator norm; integral operator; Hardy-Knopp-type inequalities; Pólya-Knopp-type inequalities

## 1 Introduction

Let $E$ be a spherical cone in $\mathbb{R}^{n}$. By this, we mean that $E=\bigcup_{s>0} s A$ for some Borel measurable subset $A$ of the unit sphere $\Sigma^{n-1}$. Let $\|\mathbb{K}\|_{D_{\mathbb{K}} \cap L_{\Phi}^{p}(\nu d x) \mapsto L_{\Phi}^{q}(u d x)}$ (in brief, $\|\mathbb{K}\|_{*}$ ) denote the smallest constant $C$ in (1.1):

$$
\begin{equation*}
\left\{\int_{E}(\Phi \circ \mathbb{K} f(x))^{q} u(x) d x\right\}^{1 / q} \leq C\left\{\int_{E}(\Phi \circ f(x))^{p} v(x) d x\right\}^{1 / p} \tag{1.1}
\end{equation*}
$$

for all $f \in D_{\mathbb{K}} \cap L_{\Phi}^{p}(v d x)$, where $p, q>0, u(x) \geq 0, v(x)>0, \Phi \in C V^{+}(I), \Phi \circ f(x)=\Phi(f(x))$, and $\mathbb{K} f(x)$ is of the form

$$
\begin{equation*}
\mathbb{K} f(x):=\int_{\tilde{S}_{x}} k(x, t) f(t) d t \quad(x \in E) . \tag{1.2}
\end{equation*}
$$

Here $\mathrm{CV}^{+}(I)$ denotes the set of all nonnegative convex functions defined on an open interval $I$ in $\mathbb{R}, D_{\mathbb{K}}$ is the space of those $f$ such that $\mathbb{K} f(x)$ is well defined for almost all $x \in E$, and $L_{\Phi}^{p}(v d x)$ is the set of all real-valued Borel measurable $f$ with

$$
\|f\|_{\Phi, p, v}:=\left\{\int_{E}(\Phi \circ f(x))^{p} v(x) d x\right\}^{1 / p}<\infty .
$$

Moreover, $\tilde{S}_{x}=\bigcup_{0<s \leq\|x\|} s A, S_{x}=\tilde{S}_{x} \backslash\|x\| A$, and $k(x, t) \geq 0$ is locally integrable over $\mathbb{E} \times \mathbb{E}$.

We write $L^{p}(v d x)$ and $\|f\|_{p, v}$ instead of $L_{\Phi}^{p}(v d x)$ and $\|f\|_{\Phi, p, v}$, respectively, for the case $\Phi(s)=|s|$. We also write $L^{p}(E, v d x)$ for $L^{p}(v d x)$, whenever the integral region $E$ is emphasized.

Clearly,

$$
\|\mathbb{K}\|_{*}=\sup _{f} \frac{\|\Phi \circ \mathbb{K} f\|_{q, u}}{\|\Phi \circ f\|_{p, v}}
$$

where the supremum is taken over all $f \in D_{\mathbb{K}} \cap L_{\Phi}^{p}(v d x)$ with $\|\Phi \circ f\|_{p, v} \neq 0$. This number reduces to the operator norm of $\mathbb{K}$ for the case $\Phi(s)=|s|$. The investigation of the value $\|\mathbb{K}\|_{*}$ has a long history in the literature. In [1], the present authors introduced a generalized Muckenhoupt constant $A_{M}(p, q)$ and established the following Muckenhoupt-type estimate for $\|\mathbb{K}\|_{*}$ :

$$
\begin{equation*}
\|\mathbb{K}\|_{*} \leq\left(\frac{q}{p^{*}}+\frac{q}{\eta}\right)^{1 / q}\left(1+\frac{p^{*}}{\eta}\right)^{\eta^{*} /\left(p^{*} q^{*}\right)} A_{M}(p, q) \tag{1.3}
\end{equation*}
$$

where $1 \leq p, q \leq \infty, \eta=\max (p, q)$, and $(\cdot)^{*}$ is the conjugate exponent of $(\cdot)$ in the sense that $1 /(\cdot)+1 /(\cdot)^{*}=1$. For the particular case that

$$
\begin{equation*}
\Phi(s)=|s|, \quad k(x, t)=1, \tag{1.4}
\end{equation*}
$$

there are two other types of estimates. They are

$$
\begin{equation*}
\|\mathbb{K}\|_{*} \leq p^{*} A_{P S}(p, q) \tag{1.5}
\end{equation*}
$$

and

$$
\begin{equation*}
\|\mathbb{K}\|_{*} \leq A_{W}(p, q):=\inf _{1<s<p} A_{W}(s, p, q)\left(\frac{p-1}{p-s}\right)^{1 / p^{*}} \tag{1.5a}
\end{equation*}
$$

These two inequalities were proved in [2] and [3], Theorem 3.1 and Lemma 7.4, for the case $1<p \leq q<\infty$ (see also [4], Theorem 2.1). We refer the readers to Section 2 for details.

In this paper, we focus on the evaluation of $\|\mathbb{K}\|_{*}$ for the following case of (1.1):

$$
\Phi(s)=e^{s}, \quad k(x, t)=g(t) / G(x), \quad f(t) \longrightarrow \log f(t)
$$

where $f(t)>0, g(t)>0$, and

$$
\begin{equation*}
G(x)=\int_{\tilde{S}_{x}} g(t) d t \quad(x \in E) \tag{1.6}
\end{equation*}
$$

The corresponding inequality to (1.1) takes the form

$$
\begin{equation*}
\left(\int_{E}\left\{\exp \left(\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) \log f(t) d t\right)\right\}^{q} u(x) d x\right)^{1 / q} \leq C\left\{\int_{E}(f(x))^{p} v(x) d x\right\}^{1 / p} \tag{1.7}
\end{equation*}
$$

which is known as the Pólya-Knopp-type inequality.

In [4], Theorem 3.1, [2, 5], and [3], Theorem 7.3, the particular case $g(t)=1$ of (1.7) was considered. They obtained the following estimates by means of the formula $\left(G_{\mathbb{K}} f\right)(x)=$ $\lim _{\epsilon \rightarrow 0^{+}}\left[\mathbb{K}\left(f^{\epsilon}\right)\right]^{1 / \epsilon}(x)$ :

$$
\begin{equation*}
\|\mathbb{K}\|_{*} \leq e^{1 / p} D_{P S}^{*} \quad \text { and } \quad\|\mathbb{K}\|_{*} \leq \inf _{s>1} e^{(s-1) / p} D_{O G}^{*}(s), \tag{1.8}
\end{equation*}
$$

where $0<p \leq q<\infty$. The definitions of $D_{P S}^{*}$ and $D_{O G}^{*}(s)$ are given in Section 3.
The purpose of this paper is two-fold. We not only extend the aforementioned sufficient parts of $[2,4,5]$, and [3] from $u(x)>0$ and $g(t)=1$ to $u(x) \geq 0$ and

$$
\begin{equation*}
\min \left(\sup _{x \in E}|g(x)|, \sup _{x \in E}\left|\frac{g(x)}{v(x)}\right|\right)<\infty \tag{1.9}
\end{equation*}
$$

but we also provide a new proof of (1.8) from the viewpoint of (1.10):

$$
\begin{equation*}
\|\mathbb{K}\|_{*} \leq \inf _{\epsilon \in \mathfrak{F}_{\Phi}^{+}}\left(A_{p / \epsilon, q / \epsilon}\right)^{1 / \epsilon} \leq \liminf _{\epsilon \rightarrow 0^{+}}\left\{\left(A_{p / \epsilon, q / \epsilon}\right)^{1 / \epsilon}\right\} \tag{1.10}
\end{equation*}
$$

where $0<p, q<\infty, \mathfrak{F}_{\Phi}^{+}=\left\{\epsilon>0: \Phi^{\epsilon} \in C V^{+}(I)\right\}$, and $A_{p, q}$ are absolute constants subject to the condition

$$
\begin{equation*}
\left(\int_{E}|\mathbb{K} f(x)|^{q} u(x) d x\right)^{1 / q} \leq A_{p, q}\left(\int_{E}|f(x)|^{p} v(x) d x\right)^{1 / p} \quad(f \geq 0) \tag{1.11}
\end{equation*}
$$

It is clear that (1.10) is applicable to the case $\Phi(s)=e^{s}$. In this case, $\mathfrak{F}_{\Phi}^{+}=\{\epsilon>0\}$ and the second inequality in (1.10) holds. We remark that it may not be an equality (cf. [6]). On the other hand, we have $p / \epsilon \rightarrow \infty$ and $q / \epsilon \rightarrow \infty$ as $\epsilon \rightarrow 0^{+}$. This indicates that the infimum in (1.10) can be estimated by evaluating those $A_{p, q}$ with $p, q$ large enough.

The limit process (1.10) differs from the scheme by means of the formula $\left(G_{\mathbb{K}} f\right)(x)=$ $\lim _{\epsilon \rightarrow 0^{+}}\left[\mathbb{K}\left(f^{\epsilon}\right)\right]^{1 / \epsilon}(x)$. It was introduced in [6] to get different types of Pólya-Knopp inequalities, including the $n$-dimensional extensions of the Levin-Cochran-Lee-type inequalities and Carleson's result. We showed that the infimum in (1.10) can easily be evaluated by applying the following choice of $A_{p, q}$ for $1<p, q<\infty$ :

$$
A_{p, q} \leq\left(\frac{q}{p^{*}}+\frac{q}{\eta}\right)^{1 / q}\left(1+\frac{p^{*}}{\eta}\right)^{\eta^{*} /\left(p^{*} q^{*}\right)} A_{M}(p, q)
$$

This choice is due to (1.3). We also pointed out that for some cases, the values of $\|\mathbb{K}\|_{*}$ obtained from (1.10) are better than the known constants in the literature. In this paper, we consider two other choices of $A_{p, q}$ with $1<p \leq q<\infty$, that is, $A_{p, q} \leq p^{*} \tilde{A}_{P S}(p, q)$ and $A_{p, q} \leq \tilde{A}_{W}(p, q)$, which are general forms of (1.5) and (1.5a). We shall derive them from (1.5) and (1.5a) and relax the conditions on $u(x)$ and $g(t)$ from $u(x)>0$ and $g(t)=1$ to $u(x) \geq 0$ and $g(t)>0$ (cf. Section 2). Based on such choices, we prove that (1.8) follows from (1.10). Moreover, (1.8) can be extended from $u(x)>0$ and $g(t)=1$ to $u(x) \geq 0$ and $g(t)$ of the form (1.9). This extension gives Persson-Stepanov-type and Opic-Gurka-tpye estimates of the modular-type operator norm of the general geometric mean operator corresponding to $g(t)$. We remark that the particular case $g(t)=\left|\tilde{S}_{t}\right|^{s-1}$ can lead us to the Levin-Cochran-Lee-type inequality (see Section 3 for details).

## 2 General forms of (1.5) and (1.5a)

Let $1<p \leq q<\infty, g(t)>0, u(x) \geq 0$, and $v(x)>0$. Consider the inequality:

$$
\begin{equation*}
\left(\int_{E}\left\{\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) f(t) d t\right\}^{q} u(x) d x\right)^{1 / q} \leq C\left(\int_{E}(f(x))^{p} v(x) d x\right)^{1 / p} \quad(f \geq 0) \tag{2.1}
\end{equation*}
$$

where $G(x)$ is defined by (1.6). This corresponds to the case $\Phi(s)=|s|$ and $k(x, t)=g(t) / G(x)$ of (1.1). Inequality (2.1) reduces to the form (2.2) for the case $g(t)=1$ :

$$
\begin{equation*}
\left(\int_{E}\left\{\int_{\tilde{S}_{x}} f(t) d t\right\}^{q} \tilde{u}(x) d x\right)^{1 / q} \leq C\left(\int_{E}(f(x))^{p} v(x) d x\right)^{1 / p} \quad(f \geq 0) \tag{2.2}
\end{equation*}
$$

where $\tilde{u}(x)=u(x) / G(x)^{q}$. In [4], Theorem 2.1, [2] and [3], Lemma 7.4(a), it was proved that under the conditions $u(x)>0$ and $A_{P S}(p, q)<\infty,(1.5)$ holds, in other words, (2.2) with $\tilde{u}(x)$ replaced by $u(x)$ is true for $C=p^{*} A_{P S}(p, q)$, where

$$
A_{P S}(p, q):=\sup _{x \in E}\left(\int_{\tilde{S}_{x}} v(t)^{1-p *} d t\right)^{-1 / p}\left(\int_{\tilde{S}_{x}}\left\{\int_{\tilde{S}_{t}} v(y)^{1-p *} d y\right\}^{q} u(t) d t\right)^{1 / q} .
$$

This result will be extended below from $g(t)=1$ and $u(x)>0$ to $g(t)>0$ and $u(x) \geq 0$. We shall see its application in the proof of Theorem 3.2.

Theorem 2.1 Let $1<p \leq q<\infty, u(x) \geq 0, v(x)>0, g(t)>0$, and $0<G(x)<\infty$, where $G(x)$ is defined by (1.6). If $\tilde{A}_{P S}(p, q)<\infty$, then (2.1) holds for $C \leq p^{*} \tilde{A}_{P S}(p, q)$, where

$$
\tilde{A}_{P S}(p, q)=\sup _{x \in E}\left(\int_{\tilde{S}_{x}}\left(\frac{g(t)}{v(t)}\right)^{p *} v(t) d t\right)^{\frac{-1}{p}}\left(\int_{\tilde{S}_{x}}\left\{\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{p *} v(y) d y\right\}^{q} u(t) d t\right)^{\frac{1}{q}} .
$$

Proof The case $u(x)>0$ follows from [4], Theorem 2.1, or [3], Lemma 7.4(a), under the following substitutions:

$$
\begin{equation*}
f(t) \longrightarrow g(t) f(t), \quad u(x) \longrightarrow \frac{u(x)}{(G(x))^{q}}, \quad v(x) \longrightarrow \frac{v(x)}{(g(x))^{p}} \tag{2.3}
\end{equation*}
$$

As for $u(x) \geq 0$, let $u_{\tau}(x)=u(x)+\rho_{\tau}(x)$, where $0<\tau<1$ and $\rho_{\tau}(x)>0$ is subject to the condition

$$
\begin{equation*}
\int_{\tilde{S}_{x}}\left\{\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{p^{*}} v(y) d y\right\}^{q} \rho_{\tau}(t) d t \leq \tau\left\{\int_{\tilde{S}_{x}}\left(\frac{g(t)}{v(t)}\right)^{p^{*}} v(t) d t\right\}^{q / p} . \tag{2.4}
\end{equation*}
$$

Such $\rho_{\tau}(x)$ exists. We have $u_{\tau}(x)>0$ on $E$. Moreover, the condition $1 / q<1$ implies that $(a+b)^{1 / q} \leq a^{1 / q}+b^{1 / q}$ for all $a, b \geq 0$. Putting this together with (2.4) yields

$$
\begin{aligned}
& \left(\int_{\tilde{S}_{x}}\left\{\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{p^{*}} v(y) d y\right\}^{q} u_{\tau}(t) d t\right)^{1 / q} \\
& \quad \leq\left(\int_{\tilde{S}_{x}}\left\{\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{p^{*}} v(y) d y\right\}^{q} u(t) d t\right)^{\frac{1}{q}}+\tau^{\frac{1}{q}}\left\{\int_{\tilde{S}_{x}}\left(\frac{g(t)}{v(t)}\right)^{p^{*}} v(t) d t\right\}^{\frac{1}{p}} .
\end{aligned}
$$

This leads us to

$$
\begin{equation*}
\tilde{A}_{P S}(p, q, \tau) \leq \tilde{A}_{P S}(p, q)+\tau^{1 / q}<\infty, \tag{2.5}
\end{equation*}
$$

where $\tilde{A}_{P S}(p, q, \tau)$ is the number obtained from $\tilde{A}_{P S}(p, q)$ by replacing $u(t)$ by $u_{r}(t)$. We have $u_{\tau}(x)>u(x)$ on $E$. By the result of the case $u(x)>0$, the following inequality holds for $f \geq 0$ :

$$
\begin{align*}
& \left(\int_{E}\left\{\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) f(t) d t\right\}^{q} u(x) d x\right)^{\frac{1}{q}} \\
& \quad \leq\left(\int_{E}\left\{\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) f(t) d t\right\}^{q} u_{\tau}(x) d x\right)^{\frac{1}{q}} \\
& \quad \leq p^{*} \tilde{A}_{P S}(p, q, \tau)\left(\int_{E}(f(x))^{p} v(x) d x\right)^{\frac{1}{p}} \tag{2.6}
\end{align*}
$$

It follows from (2.5) that $\liminf _{\tau \rightarrow 0^{+}} \tilde{A}_{P S}(p, q, \tau) \leq \tilde{A}_{P S}(p, q)$. Putting this together with (2.6) yields the desired inequality. The proof is complete.

Next, consider (1.5a). The number $A_{W}(s, p, q)$ in (1.5a) is defined by the formula:

$$
A_{W}(s, p, q)=\sup _{x \in E}\left(\int_{\tilde{S}_{x}} v(t)^{1-p *} d t\right)^{\frac{s-1}{p}}\left(\int_{E \backslash S_{x}}\left\{\int_{\tilde{S}_{t}} v(y)^{1-p *} d y\right\}^{\frac{q(p-s)}{p}} u(t) d t\right)^{\frac{1}{q}}
$$

In [3], Lemma 7.4(b), $A_{W}(s, p, q)$ is replaced by another notation $A_{W}^{*}(s)$. Like (1.5), (1.5a) can be generalized in the following way, in which $g(t)=1$ and $u(x)>0$ are relaxed to $g(t)>0$ and $u(x) \geq 0$. We shall see its application in the proof of Theorem 3.3.

Theorem 2.2 Let $1<p \leq q<\infty, u(x) \geq 0, v(x)>0, g(t)>0$, and $0<G(x)<\infty$, where $G(x)$ is defined by (1.6). If $\tilde{A}_{W}(s, p, q)<\infty$ for some $1<s<p$, then (2.1) holds for $C \leq \tilde{A}_{W}(p, q)$, where

$$
\begin{equation*}
\tilde{A}_{W}(p, q):=\inf _{1<s<p} \tilde{A}_{W}(s, p, q)\left(\frac{p-1}{p-s}\right)^{1 / p^{*}} \tag{2.7}
\end{equation*}
$$

and

$$
\begin{align*}
\tilde{A}_{W}(s, p, q)= & \sup _{x \in E}\left(\int_{\tilde{S}_{x}}\left(\frac{g(t)}{v(t)}\right)^{p^{*}} v(t) d t\right)^{\frac{s-1}{p}} \\
& \times\left(\int_{E \backslash S_{x}}\left\{\int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{p^{*}} v(y) d y\right\}^{\frac{q(p-s)}{p}} \frac{u(t) d t}{(G(t))^{q}}\right)^{\frac{1}{q}} \tag{2.8}
\end{align*}
$$

Proof The case $u(x)>0$ follows from [3], Lemma 7.4(b), under the substitutions (2.3). For the case $u(x) \geq 0$, we modify the proof of Theorem 2.1 in the following way. Let $1<s<p$ and $0<\tau<1$. Set $u_{\tau}(x, s)=u(x)+\rho_{\tau}(x, s)$, where $\rho_{\tau}(x, s)>0$ and satisfies the condition

$$
\int_{E \backslash S_{x}}\left\{\int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{p^{*}} v(y) d y\right\}^{\frac{q(p-s)}{p}} \frac{\rho_{\tau}(t, s)}{(G(t))^{q}} d t \leq \tau\left(\frac{p-1}{p-s}\right)^{\frac{-q}{p^{*}}}\left\{\int_{\tilde{S}_{x}}\left(\frac{g(t)}{v(t)}\right)^{p^{*}} v(t) d t\right\}^{\frac{q(1-s)}{p}} .
$$

Such $\rho_{\tau}(x, s)$ exists. We have $u_{\tau}(x, s)>0$ on $x \in E$. Moreover,

$$
\begin{equation*}
\tilde{A}_{W}^{\tau}(s, p, q) \leq \tilde{A}_{W}(s, p, q)+\tau^{1 / q}\left(\frac{p-1}{p-s}\right)^{-1 / p^{*}} \tag{2.9}
\end{equation*}
$$

where $\tilde{A}_{W}^{\tau}(s, p, q)$ is obtained from $\tilde{A}_{W}(s, p, q)$ by making the change in (2.8): $u(t) \longrightarrow$ $u_{\tau}(t, s)$. Obviously, $u_{\tau}(x, s)>u(x)$. Applying the preceding result of the case $u(x)>0$ to $u_{\tau}(x, s)$, we get

$$
\begin{align*}
& \left(\int_{E}\left\{\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) f(t) d t\right\}^{q} u(x) d x\right)^{1 / q} \\
& \quad \leq\left(\int_{E}\left\{\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) f(t) d t\right\}^{q} u_{\tau}(x, s) d x\right)^{1 / q} \\
& \quad \leq\left\{\inf _{1<s^{\prime}<p} \tilde{A}_{W}^{\tau}\left(s^{\prime}, p, q\right)\left(\frac{p-1}{p-s^{\prime}}\right)^{1 / p^{*}}\right\}\left(\int_{E}(f(x))^{p} v(x) d x\right)^{1 / p} \\
& \quad \leq \tilde{A}_{W}^{\tau}(s, p, q)\left(\frac{p-1}{p-s}\right)^{1 / p^{*}}\left(\int_{E}(f(x))^{p} v(x) d x\right)^{1 / p} . \tag{2.10}
\end{align*}
$$

Taking 'inf $\mathrm{l}_{1<s<p}$ ' for both sides of (2.10), we get

$$
\begin{equation*}
\left(\int_{E}\left\{\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) f(t) d t\right\}^{q} u(x) d x\right)^{1 / q} \leq \tilde{A}_{W}^{\tau}(p, q)\left(\int_{E}(f(x))^{p} v(x) d x\right)^{1 / p} \tag{2.11}
\end{equation*}
$$

Here

$$
\tilde{A}_{W}^{\tau}(p, q)=\inf _{1<s<p} \tilde{A}_{W}^{\tau}(s, p, q)\left(\frac{p-1}{p-s}\right)^{1 / p^{*}}
$$

From (2.9), we obtain $\tilde{A}_{W}^{\tau}(p, q) \leq \tilde{A}_{W}(p, q)+\tau^{1 / q}$. Taking $\tau \rightarrow 0^{+}$for both sides of (2.11), we get the desired inequality. This completes the proof.

## 3 Extensions and new proofs of (1.8)

To derive the extensions of (1.8), we need the following lemma.

Lemma 3.1 Let $0<p<\infty, v(x)>0, g(t)>0$, and $0<G(x)<\infty$, where $G(x)$ is defined by (1.6). If $\sup _{x \in E}\{g(x) / v(x)\}<\infty$, then, for all $t \in E$,

$$
\begin{equation*}
\lim _{\epsilon \rightarrow 0^{+}}\left(\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\frac{\epsilon}{p-\epsilon}} g(y) d y\right)^{\frac{1}{\epsilon}}=\left\{\exp \left(\frac{1}{G(t)} \int_{\tilde{S}_{t}} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y\right)\right\}^{\frac{1}{p}} . \tag{3.1}
\end{equation*}
$$

Proof Let $\alpha \geq \sup _{x \in E}\{g(x) / v(x)\}$. Without loss of generality, we may assume $\alpha>1$. We first consider the case that $\int_{\tilde{S}_{t}} g(y) \left\lvert\, \log \left(\left.\frac{g(y)}{v(y)} \right\rvert\, d y<\infty\right.$. Let \right.

$$
h(\epsilon)=\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon /(p-\epsilon)} g(y) d y \quad(0 \leq \epsilon<p / 2)
$$

We have

$$
\int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon /(p-\epsilon)} g(y) d y \leq \alpha^{\epsilon /(p-\epsilon)} G(t)<\infty
$$

so $h(\epsilon)$ is well defined and has a finite value. For $\epsilon \in[0, p / 2)$ and $0<\tau<\min (p / 2-\epsilon, \epsilon)$, it follows from the mean value theorem that

$$
\begin{align*}
\frac{h(\epsilon+\tau)-h(\epsilon)}{\tau} & =\frac{1}{G(t)} \int_{\tilde{S}_{t}} \frac{1}{\tau}\left\{\left(\frac{g(y)}{v(y)}\right)^{\frac{\epsilon+\tau}{p-\epsilon-\tau}}-\left(\frac{g(y)}{v(y)}\right)^{\frac{\epsilon}{p-\epsilon}}\right\} g(y) d y \\
& =\frac{p}{G(t)} \int_{\tilde{S}_{t}} \frac{1}{\left(p-\epsilon_{0}\right)^{2}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{0} /\left(p-\epsilon_{0}\right)} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y \tag{3.2}
\end{align*}
$$

where $\epsilon_{0}:=\epsilon_{0}(y)$ lies between $\epsilon$ and $\epsilon+\tau$. We know that

$$
\frac{\chi_{\tilde{S}_{t}}(y)}{\left(p-\epsilon_{0}\right)^{2}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{0} /\left(p-\epsilon_{0}\right)} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| \leq \frac{\alpha \chi_{\tilde{S}_{t}}(y) g(y)}{(p-\epsilon)^{2}}\left|\log \left(\frac{g(y)}{v(y)}\right)\right| \in L^{1}(E, d y) .
$$

By (3.2) and the Lebesgue dominated convergence theorem, $h$ is differentiable on [0, $p / 2$ ). In addition,

$$
h^{\prime}(\epsilon)=\lim _{\tau \rightarrow 0^{+}} \frac{h(\epsilon+\tau)-h(\epsilon)}{\tau}=\frac{p}{(p-\epsilon)^{2} G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon /(p-\epsilon)} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y .
$$

Thus,

$$
\begin{aligned}
& \lim _{\epsilon \rightarrow 0^{+}} \log \left(\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon /(p-\epsilon)} g(y) d y\right)^{1 / \epsilon} \\
& \quad=\lim _{\epsilon \rightarrow 0^{+}} \frac{\log h(\epsilon)-\log h(0)}{\epsilon} \\
& \quad=\left.\frac{d}{d \epsilon}(\log h(\epsilon))\right|_{\epsilon=0}=\frac{h^{\prime}(0)}{h(0)}=\frac{1}{p G(t)} \int_{\tilde{S}_{t}} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y .
\end{aligned}
$$

We get the desired result for the case $\int_{\tilde{S}_{t}} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| d y<\infty$. Next, consider the case $\int_{\tilde{S}_{t}} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| d y=\infty$. This implies

$$
\begin{equation*}
\infty=\int_{\Omega_{1}} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| d y+\int_{\Omega_{2}} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| d y \tag{3.3}
\end{equation*}
$$

where $\Omega_{1}=\left\{y \in \tilde{S}_{t}: g(y) / v(y) \leq 1\right\}$ and $\Omega_{2}=\left\{y \in \tilde{S}_{t}: g(y) / v(y)>1\right\}$. We have

$$
\int_{\Omega_{2}} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| d y \leq(\log \alpha) G(t)<\infty .
$$

Combining this with (3.3), we find that $\int_{\Omega_{1}} g(y)\left|\log \left(\frac{g(v)}{v(y)}\right)\right| d y=\infty$. This leads us to

$$
\int_{\tilde{S}_{t}} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y=-\int_{\Omega_{1}} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| d y+\int_{\Omega_{2}} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| d y=-\infty .
$$

We shall show

$$
\lim _{\epsilon \rightarrow 0^{+}}\left(\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon /(p-\epsilon)} g(y) d y\right)^{1 / \epsilon}=0 .
$$

If so, the desired equality follows. Let $0<\epsilon<p / 2$ and $y \in \tilde{S}_{t}$. By the mean value theorem, we get

$$
\left(\frac{g(y)}{v(y)}\right)^{\epsilon /(p-\epsilon)}-1=\frac{\epsilon p}{\left(p-\epsilon_{0}\right)^{2}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{0} /\left(p-\epsilon_{0}\right)}\left(\log \frac{g(y)}{v(y)}\right)
$$

for some $\epsilon_{0} \in(0, \epsilon)$. This implies

$$
\begin{align*}
& \frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon /(p-\epsilon)} g(y) d y \\
& \quad=1+\left(\frac{\epsilon p}{G(t)} \int_{\tilde{S}_{t}} \frac{1}{\left(p-\epsilon_{0}\right)^{2}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{0} /\left(p-\epsilon_{0}\right)} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y\right) \tag{3.4}
\end{align*}
$$

By Fatou's lemma, we get

$$
\begin{aligned}
& \liminf _{\epsilon \rightarrow 0^{+}} \frac{p}{G(t)} \int_{\tilde{S}_{t}} \frac{1}{\left(p-\epsilon_{0}\right)^{2}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{0} /\left(p-\epsilon_{0}\right)} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| d y \\
& \quad \geq \frac{1}{p G(t)} \int_{\tilde{S}_{t}}\left\{\liminf _{\epsilon \rightarrow 0^{+}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{0} /\left(p-\epsilon_{0}\right)}\right\} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| d y \\
& \quad=\frac{1}{p G(t)} \int_{\tilde{S}_{t}} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| d y=\infty .
\end{aligned}
$$

Like (3.3), decompose the integral $\int_{\tilde{S}_{t}}(\cdots)$ as the sum $\int_{\Omega_{1}}(\cdots)+\int_{\Omega_{2}}(\cdots)$. For the $\Omega_{2}$ term, we have

$$
\begin{aligned}
& \frac{p}{G(t)} \int_{\Omega_{2}} \frac{1}{\left(p-\epsilon_{0}\right)^{2}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{0} /\left(p-\epsilon_{0}\right)} g(y)\left|\log \left(\frac{g(y)}{v(y)}\right)\right| d y \\
& \quad \leq \frac{4 \alpha \log \alpha}{p G(t)} \int_{\Omega_{2}} g(y) d y \leq \frac{4 \alpha \log \alpha}{p}<\infty
\end{aligned}
$$

which implies

$$
\lim _{\epsilon \rightarrow 0^{+}} \frac{p}{G(t)} \int_{\tilde{S}_{t}} \frac{1}{\left(p-\epsilon_{0}\right)^{2}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{0} /\left(p-\epsilon_{0}\right)} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y=-\infty
$$

From (3.4) and the fact that $\lim _{\epsilon \rightarrow 0}(1+\epsilon \theta)^{1 / \epsilon}=e^{\theta}$ for any $\theta \in \mathbb{R}$, we get

$$
\limsup _{\epsilon \rightarrow 0^{+}}\left(\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon /(p-\epsilon)} g(y) d y\right)^{1 / \epsilon} \leq \limsup _{\epsilon \rightarrow 0^{+}}(1+\epsilon \theta)^{1 / \epsilon}=e^{\theta}
$$

for any $\theta<0$. Letting $\theta \rightarrow-\infty$, we get the desired result.

Lemma 3.1 may be false for the case that $\sup _{x \in E} g(x) / v(x)=\infty$. A counterexample is given as follows. Consider $n=1, t=1, g(t)=1$, and $v(x)=\sum_{m=2}^{\infty} e^{-m} \chi_{\left[\frac{1}{m}-\frac{1}{m^{3}}, \frac{1}{m}\right]}(x)+$ $\chi_{\mathbb{R} \backslash \cup_{m \geq 2}\left(\frac{1}{m}-\frac{1}{m^{3}}, \frac{1}{m}\right]}(x)$. We have

$$
\int_{0}^{1}\left(\frac{g(y)}{v(y)}\right)^{\epsilon /(p-\epsilon)} g(y) d y=\int_{0}^{1} v(y)^{\epsilon /(\epsilon-p)} d y \geq \sum_{m=2}^{\infty} \frac{1}{m^{3}} e^{\frac{m \epsilon}{p-\epsilon}}=\infty \quad(0<\epsilon<p / 2)
$$

and

$$
\int_{0}^{1} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y=\int_{0}^{1} \log \frac{1}{v(y)} d y=\sum_{m=2}^{\infty} \frac{1}{m^{2}}<\infty
$$

From these, we know that (3.1) is false for this example.
Now, we go back to the investigation of the first part of (1.8). Set

$$
\tilde{D}_{P S}:=\sup _{x \in E} \frac{1}{G(x)^{\frac{1}{p}}}\left(\int_{\tilde{S}_{x}}\left\{\exp \left(\frac{1}{G(t)} \int_{\tilde{S}_{t}} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y\right)\right\}^{\frac{q}{p}} u(t) d t\right)^{\frac{1}{q}},
$$

where $G(x)$ is defined by (1.6). The case $g(t)=1$ of $\tilde{D}_{P S}$ reduces to $D_{P S}^{*}$ mentioned in (1.8). We shall establish the following result, which extends the first inequality in (1.8) from $u(x)>0$ and $g(t)=1$ to $u(x) \geq 0$ and those $g(t)$ subject to the condition (1.9). This extension gives the Persson-Stepanov-type estimate of the modular-type operator norm of the general geometric mean operator corresponding to $g(t)$. In particular, $g(t)$ can be of the form $g(t)=\left|\tilde{S}_{t}\right|^{s-1}$. An elementary calculation of this case will lead us to the Levin-Cochran-Leetype inequality. We leave such a calculation to the readers. Our result partially generalizes the sufficient parts of [4], Theorem 3.1, [2], and [3], Theorem 7.3(a).

Theorem 3.2 Let $0<p \leq q<\infty, u(x) \geq 0, v(x)>0, g(t)>0$, and $0<G(x)<\infty$, where $G(x)$ is defined by (1.6). If (1.9) is true and $\tilde{D}_{P S}<\infty$, then (1.7) holds for $C \leq e^{1 / p} \tilde{D}_{P S}$.

Proof Let $\Phi(s)=e^{s}, k(x, t)=g(t) / G(x)$, and $f(t) \longrightarrow \log f(t)$. The proof is the same as to prove that $\|\mathbb{K}\|_{*} \leq e^{1 / p} \tilde{D}_{P S}$. We first assume that $\sup _{x \in E}\{g(x) / v(x)\}<\infty$. Consider the case that $u$ is bounded on $\tilde{\Omega}_{r}$ and $u(x)=0$ on $E \backslash \tilde{\Omega}_{r}$, where $r \geq 1$ and $\tilde{\Omega}_{r}=\{x \in E: 1 / r \leq\|x\| \leq r\}$. By (1.10)-(1.11) and Theorem 2.1, we know that

$$
\begin{equation*}
\|\mathbb{K}\|_{*} \leq \liminf _{\epsilon \rightarrow 0^{+}}\left((p / \epsilon)^{*} \tilde{A}_{P S}(p / \epsilon, q / \epsilon)\right)^{1 / \epsilon} \tag{3.5}
\end{equation*}
$$

provided that the term $(\cdots)^{1 / \epsilon}$ in (3.5) is finite for all sufficiently small $\epsilon>0$. By an elementary calculation, we obtain $\lim _{\epsilon \rightarrow 0^{+}}\left((p / \epsilon)^{*}\right)^{1 / \epsilon}=\lim _{\epsilon \rightarrow 0^{+}}\left(\frac{p}{p-\epsilon}\right)^{1 / \epsilon}=e^{1 / p}$. On the other hand, let $0<\epsilon<p$. Then $p / \epsilon>1$ and $q / \epsilon>1$. Moreover, we have $(p / \epsilon)^{*}=p /(p-\epsilon)$, so

$$
\left(\frac{g(t)}{v(t)}\right)^{(p / \epsilon)^{*}} v(t)=\left(\frac{g(t)}{v(t)}\right)^{p /(p-\epsilon)} v(t)=\left(\frac{g(t)}{v(t)}\right)^{\epsilon /(p-\epsilon)} g(t) .
$$

It follows from the definition of $\tilde{A}_{P S}(p / \epsilon, q / \epsilon)$ that

$$
\begin{align*}
\left(\tilde{A}_{P S}(p / \epsilon, q / \epsilon)\right)^{1 / \epsilon}= & \sup _{x \in E}\left(\int_{\tilde{S}_{x}}\left(\frac{g(t)}{v(t)}\right)^{\epsilon /(p-\epsilon)} g(t) d t\right)^{-1 / p} \\
& \times\left(\int_{\tilde{S}_{x}}\left\{\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon /(p-\epsilon)} g(y) d y\right\}^{q / \epsilon} u(t) d t\right)^{1 / q} . \tag{3.6}
\end{align*}
$$

We have assumed that $u(x)=0$ on $E \backslash \tilde{\Omega}_{r}$. Moreover, for $t \in \tilde{S}_{x}$, we have

$$
\begin{aligned}
\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon /(p-\epsilon)} g(y) d y & \leq\left\{\sup _{y \in \tilde{S}_{x}}\left(\frac{g(y)}{v(y)}\right)\right\}^{\epsilon /(p-\epsilon)}\left\{\frac{1}{G(t)} \int_{\tilde{S}_{t}} g(y) d y\right\} \\
& =\left\{\sup _{y \in \tilde{S}_{x}}\left(\frac{g(y)}{v(y)}\right)\right\}^{\epsilon /(p-\epsilon)}
\end{aligned}
$$

These imply

$$
\begin{align*}
\left(\tilde{A}_{P S}(p / \epsilon, q / \epsilon)\right)^{1 / \epsilon} \leq & \left(\int_{\tilde{B}_{1 / r}}\left(\frac{g(t)}{v(t)}\right)^{\epsilon /(p-\epsilon)} g(t) d t\right)^{-1 / p} \\
& \times\left\{\sup _{y \in E}\left(\frac{g(y)}{v(y)}\right)\right\}^{1 /(p-\epsilon)}\left(\int_{\tilde{\Omega}_{r}} u(t) d t\right)^{1 / q}<\infty, \tag{3.7}
\end{align*}
$$

where $\tilde{B}_{\rho}=\{x \in E:\|x\| \leq \rho\}$. The above argument guarantees the validity of (3.5). Now, we try to estimate the limit infimum given in (3.5). It suffices to show that

$$
\begin{equation*}
\liminf _{\epsilon \rightarrow 0^{+}}\left(\tilde{A}_{P S}(p / \epsilon, q / \epsilon)\right)^{1 / \epsilon} \leq \tilde{D}_{P S} . \tag{3.8}
\end{equation*}
$$

Clearly, the term $\left(\int_{\tilde{S}_{x}}(\cdots)\right)^{-1 / p}$ in (3.6) becomes bigger whenever $x$ with $\|x\|>r$ is replaced by $r x /\|x\|$. Moreover, the term $\left(\int_{\tilde{S}_{x}}\{\cdots\}^{q / \epsilon} u(t) d t\right)^{1 / q}$ in (3.6) is zero for $\|x\|<1 / r$ and it keeps the same value for the change: $x$ with $\|x\|>r \longrightarrow r x /\|x\|$. Hence, the term 'sup ${ }_{x \in E}$ ' in (3.6) can be replaced by 'sup $x_{x \in \tilde{\Omega}_{r}}$ '. By the Heine-Borel theorem, we can choose $0<\epsilon_{m}<p / 2$, $\alpha_{m}>0$, and $x_{0}, x_{m} \in \tilde{\Omega}_{r}$, such that $\epsilon_{m} \rightarrow 0, \alpha_{m} \rightarrow 0, x_{m} \rightarrow x_{0}$, and the following inequality holds for all $m$ :

$$
\begin{align*}
& \left(\tilde{A}_{P S}\left(p / \epsilon_{m}, q / \epsilon_{m}\right)\right)^{1 / \epsilon_{m}} \\
& \quad \leq\left(\int_{\tilde{S}_{x_{m}}}\left(\frac{g(t)}{v(t)}\right)^{\epsilon_{m} /\left(p-\epsilon_{m}\right)} g(t) d t\right)^{-1 / p} \\
& \quad \times\left(\int_{\tilde{S}_{x_{m}}}\left\{\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{m} /\left(p-\epsilon_{m}\right)} g(y) d y\right\}^{q / \epsilon_{m}} u(t) d t\right)^{1 / q}+\alpha_{m} \tag{3.9}
\end{align*}
$$

We have

$$
\left|\chi_{\tilde{S}_{x_{m}}}(t)\left(\frac{g(t)}{v(t)}\right)^{\epsilon_{m} /\left(p-\epsilon_{m}\right)} g(t)\right| \leq \chi_{\tilde{B}_{r}}(t)\left\{\sup _{y \in E}\left(\frac{g(y)}{v(y)}\right)+1\right\} g(t) \in L^{1}(E, d t) \quad(m=1,2, \ldots) .
$$

By the Lebesgue dominated convergence theorem, we infer that

$$
\begin{align*}
& \lim _{m \rightarrow \infty}\left(\int_{\tilde{S}_{x_{m}}}\left(\frac{g(t)}{v(t)}\right)^{\epsilon_{m} /\left(p-\epsilon_{m}\right)} g(t) d t\right)^{-1 / p} \\
& \quad=\left(\int_{\tilde{S}_{x_{0}}} \lim _{m \rightarrow \infty}\left\{\left(\frac{g(t)}{v(t)}\right)^{\epsilon_{m} /\left(p-\epsilon_{m}\right)}\right\} g(t) d t\right)^{-1 / p}=\left(G\left(x_{0}\right)\right)^{-1 / p} \tag{3.10}
\end{align*}
$$

Similarly, the hypotheses on $u(t)$ and $g(t) / v(t)$ imply

$$
\begin{aligned}
& \left|\chi_{\tilde{S}_{x_{m}}}(t)\left\{\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{m} /\left(p-\epsilon_{m}\right)} g(y) d y\right\}^{q / \epsilon_{m}} u(t)\right| \\
& \quad \leq \chi_{\tilde{B}_{r}}(t)\left\{\sup _{y \in E}\left(\frac{g(y)}{v(y)}\right)\right\}^{q /\left(p-\epsilon_{m}\right)}\left\{\frac{1}{G(t)} \int_{\tilde{S}_{t}} g(y) d y\right\}^{q / \epsilon_{m}} u(t) \\
& \quad \leq \chi_{\tilde{B}_{r}}(t)\left\{\sup _{y \in E}\left(\frac{g(y)}{v(y)}\right)+1\right\}^{2 q / p} u(t) \in L^{1}(E, d t) .
\end{aligned}
$$

Applying the Lebesgue dominated convergence theorem again, it follows from Lemma 3.1 that

$$
\begin{align*}
& \lim _{m \rightarrow \infty}\left(\int_{\tilde{S}_{x_{m}}}\left\{\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{m} /\left(p-\epsilon_{m}\right)} g(y) d y\right\}^{q / \epsilon_{m}} u(t) d t\right)^{1 / q} \\
& \quad=\left(\int_{\tilde{S}_{x_{0}}} \lim _{m \rightarrow \infty}\left\{\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\epsilon_{m} /\left(p-\epsilon_{m}\right)} g(y) d y\right\}^{q / \epsilon_{m}} u(t) d t\right)^{1 / q} \\
& \quad=\left(\int_{\tilde{S}_{x_{0}}}\left\{\exp \left(\frac{1}{G(t)} \int_{\tilde{S}_{t}} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y\right)\right\}^{q / p} u(t) d t\right)^{1 / q} . \tag{3.11}
\end{align*}
$$

Putting (3.9)-(3.11) together yields (3.8). This finishes the proof for those $u$ and $v$ with the restrictions stated above. Now, we come back to the proof of the case $u \geq 0$ and $\sup _{x \in E}\{g(x) / v(x)\}<\infty$. Let $u_{r}(x)=\min \{u(x), r\} \chi_{\tilde{\Omega}_{r}}(x)$, where $r=1,2, \ldots$. By the preceding result,

$$
\begin{align*}
& \left(\int_{E}\left\{\exp \left(\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) \log f(t) d t\right)\right\}^{q} u_{r}(x) d x\right)^{1 / q} \\
& \quad \leq e^{1 / p} \tilde{D}_{P S}(r)\left(\int_{E}(f(x))^{p} v(x) d x\right)^{1 / p} \quad(f>0), \tag{3.12}
\end{align*}
$$

where

$$
\tilde{D}_{P S}(r)=\sup _{x \in E}(G(x))^{-\frac{1}{p}}\left(\int_{\tilde{S}_{x}}\left\{\exp \left(\frac{1}{G(t)} \int_{\tilde{S}_{t}} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y\right)\right\}^{\frac{q}{p}} u_{r}(t) d t\right)^{\frac{1}{q}} .
$$

We have $u_{r}(t) \leq u(t)$, so $\tilde{D}_{P S}(r) \leq \tilde{D}_{P S}$. Replacing $\tilde{D}_{P S}(r)$ in (3.12) by $\tilde{D}_{P S}$ first and then applying the monotone convergence theorem to (3.12), we get the desired inequality for this case.

Next, we deal with the case $\sup _{x \in E} g(x)<\infty$. Let $v_{\ell}(x)=v(x)+1 / \ell$, where $\ell=1,2, \ldots$. Then $\sup _{x \in E}\left\{g(x) / \nu_{\ell}(x)\right\}<\infty$ for each $\ell$. By the preceding result,

$$
\begin{align*}
& \left(\int_{E}\left\{\exp \left(\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) \log f(t) d t\right)\right\}^{q} u(x) d x\right)^{1 / q} \\
& \quad \leq e^{1 / p} \tilde{D}_{P S}^{\ell}\left(\int_{E}(f(x))^{p} v_{\ell}(x) d x\right)^{1 / p} \quad(f>0), \tag{3.13}
\end{align*}
$$

where

$$
\tilde{D}_{P S}^{\ell}=\sup _{x \in E} \frac{1}{(G(x))^{\frac{1}{p}}}\left(\int_{\tilde{S}_{x}}\left\{\exp \left(\frac{1}{G(t)} \int_{\tilde{S}_{t}} g(y) \log \left(\frac{g(y)}{v_{\ell}(y)}\right) d y\right)\right\}^{\frac{q}{p}} u(t) d t\right)^{\frac{1}{q}} .
$$

We have $v_{\ell}(x) \geq v(x)$, so $\tilde{D}_{P S}^{\ell} \leq \tilde{D}_{P S}$. This says that (3.13) can be replaced by (3.14):

$$
\begin{align*}
& \left(\int_{E}\left\{\exp \left(\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) \log f(t) d t\right)\right\}^{q} u(x) d x\right)^{1 / q} \\
& \quad \leq e^{1 / p} \tilde{D}_{P S}\left(\int_{E}(f(x))^{p} v_{\ell}(x) d x\right)^{1 / p} \quad(f>0) \tag{3.14}
\end{align*}
$$

We shall claim that $v_{\ell}(x)$ in (3.14) can be replaced by $v(x)$. Without loss of generality, we may assume $\int_{E}(f(x))^{p} v(x) d x<\infty$. Set

$$
f_{r}(x)=\chi_{\tilde{B}_{r}}(x) \min (f(x), r)+\chi_{E \backslash \tilde{B}_{r}}(x) h(x) \quad(r=1,2, \ldots),
$$

where $\tilde{B}_{\rho}$ is defined before and $h: E \mapsto(0, \infty)$ is chosen so that

$$
h(x) \leq \min (f(x), 1) \quad \text { and } \quad \int_{E}(h(x))^{p} v_{1}(x) d x<\infty
$$

Replacing $f$ in (3.14) by $f_{r}$, we get

$$
\begin{align*}
& \left(\int_{E}\left\{\exp \left(\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) \log f_{r}(t) d t\right)\right\}^{q} u(x) d x\right)^{1 / q} \\
& \quad \leq e^{1 / p} \tilde{D}_{P S}\left(\int_{E}\left(f_{r}(x)\right)^{p} v_{\ell}(x) d x\right)^{1 / p} \tag{3.15}
\end{align*}
$$

For each $r$, we have

$$
\begin{aligned}
\int_{E}\left(f_{r}(x)\right)^{p} v_{1}(x) d x & =\int_{\tilde{B}_{r}}(\min (f(x), r))^{p} v_{1}(x) d x+\int_{E \backslash \tilde{B}_{r}}(h(x))^{p} v_{1}(x) d x \\
& \leq \int_{E}(f(x))^{p} v(x) d x+\int_{\tilde{B}_{r}} r^{p} d x+\int_{E}(h(x))^{p} v_{1}(x) d x<\infty
\end{aligned}
$$

and $\left|f_{r}(x)\right|^{p} \nu_{\ell}(x) \leq\left(f_{r}(x)\right)^{p} \nu_{1}(x)$ for $\ell=1,2, \ldots$. Applying the Lebesgue dominated convergence theorem to the right hand side of (3.15), we get

$$
\begin{align*}
& \left(\int_{E}\left\{\exp \left(\frac{1}{G(x)} \int_{\tilde{S}_{x}} g(t) \log f_{r}(t) d t\right)\right\}^{q} u(x) d x\right)^{1 / q} \\
& \quad \leq e^{1 / p} \tilde{D}_{P S}\left(\int_{E}\left(f_{r}(x)\right)^{p} v(x) d x\right)^{1 / p} \tag{3.16}
\end{align*}
$$

By definition, $f_{r}(x) \uparrow f(x)$ as $r \rightarrow \infty$. Applying the monotone convergence theorem to both sides of (3.16), the right hand side tends to

$$
e^{1 / p} \tilde{D}_{P S}\left(\int_{E}(f(x))^{p} v(x) d x\right)^{1 / p} \quad(\text { as } r \rightarrow \infty)
$$

and the left hand side has the limit

$$
\begin{equation*}
\left(\int_{E}\left\{\exp \left(\frac{1}{G(x)} \lim _{r \rightarrow \infty} \int_{\tilde{S}_{x}} g(t) \log f_{r}(t) d t\right)\right\}^{q} u(x) d x\right)^{1 / q} . \tag{3.17}
\end{equation*}
$$

Let $x \in E$. Since $\int_{\tilde{S}_{x}} g(t) \log f(t) d t$ is well defined, the following equality makes sense:

$$
\int_{\tilde{S}_{x}} g(t) \log f(t) d t=\int_{\tilde{S}_{x}} g(t)(\log f(t))^{+} d t-\int_{\tilde{S}_{x}} g(t)(\log f(t))^{-} d t,
$$

where $\xi^{+}=\max (\xi, 0)$ and $\xi^{-}=\min (-\xi, 0)$. Consider $r \geq \max (\|x\|, 1)$. By the monotone convergence theorem,

$$
\begin{aligned}
\int_{\tilde{S}_{x}} g(t) \log f_{r}(t) d t & =\int_{\tilde{S}_{x}} g(t) \log \{\min (f(t), r)\} d t \\
& =\int_{\tilde{S}_{x}} g(t) \min \left((\log f(t))^{+}, \log r\right) d t-\int_{\tilde{S}_{x}} g(t)(\log f(t))^{-} d t \\
& \longrightarrow \int_{\tilde{S}_{x}} g(t)(\log f(t))^{+} d t-\int_{\tilde{S}_{x}} g(t)(\log f(t))^{-} d t=\int_{\tilde{S}_{x}} g(t) \log f(t) d t .
\end{aligned}
$$

Inserting this limit in (3.17) yields the desired inequality. This finishes the proof.

Theorem 3.2 gives a new proof of [3], Theorem 7.3(a). In the following, we shall display another example to show how (1.10) works well for the estimate of Opic-Gurka type. Set

$$
\begin{aligned}
\tilde{D}_{O G}(s):= & \sup _{x \in E}(G(x))^{\frac{s-1}{p}} \\
& \times\left(\int_{E \backslash S_{x}}(G(t))^{\frac{-s q}{p}}\left\{\exp \left(\frac{1}{G(t)} \int_{\tilde{S}_{t}} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y\right)\right\}^{\frac{q}{p}} u(t) d t\right)^{\frac{1}{q}},
\end{aligned}
$$

where $G(x)$ is defined by (1.6). The number $D_{O G}^{*}(s)$ in (1.8) is just the case $g(t)=1$ of $\tilde{D}_{O G}(s)$. In the following, we shall extend the second inequality in (1.8) from $u(x)>0$ and $g(t)=1$ to $u(x) \geq 0$ and those $g(t)$ subject to the condition (1.9). This extension gives the Opic-Gurkatype estimate of the modular-type operator norm of the general geometric mean operator
corresponding to $g(t)$. In particular, $g(t)$ can be of the form $g(t)=\left|\tilde{S}_{t}\right|^{s-1}$, which leads us to the Levin-Cochran-Lee-type inequality. Our result partially generalizes the sufficient parts of [5] and [3], Theorem 7.3(b).

Theorem 3.3 Let $0<p \leq q<\infty, u(x) \geq 0, v(x)>0, g(t)>0$, and $0<G(x)<\infty$, where $G(x)$ is defined by (1.6). If (1.9) is true and $\tilde{D}_{O G}(s)<\infty$ for some $s>1$, then (1.7) holds for $C \leq \inf _{s>1} e^{(s-1) / p} \tilde{D}_{O G}(s)$.

Proof Let $\Phi(s)=e^{s}, k(x, t)=g(t) / G(x)$, and $f(t) \longrightarrow \log f(t)$. The proof is similar to Theorem 3.2. We shall show that $\|\mathbb{K}\|_{*} \leq \inf _{s>1} e^{(s-1) / p} \tilde{D}_{O G}(s)$. To observe the proof of Theorem 3.2, we find that it suffices to prove this inequality for the case: $u$ is bounded on $\tilde{\Omega}_{r}$, $u(x)=0$ on $E \backslash \tilde{\Omega}_{r}$, and $\sup _{x \in E}\{g(x) / v(x)\}<\infty$, where $\tilde{\Omega}_{r}$ is defined in the proof of Theorem 3.2. It follows from (1.10)-(1.11) and Theorem 2.2 that

$$
\begin{align*}
\|\mathbb{K}\|_{*} & \leq \inf _{0<\epsilon<p}\left(\tilde{A}_{W}(p / \epsilon, q / \epsilon)\right)^{1 / \epsilon} \\
& =\inf _{0<\epsilon<p}\left\{\inf _{1<s<p / \epsilon}\left(\frac{p-\epsilon}{p-\epsilon S}\right)^{1 / \epsilon-1 / p}\left(\tilde{A}_{W}(s, p / \epsilon, q / \epsilon)\right)^{1 / \epsilon}\right\} \\
& \leq \inf _{s>1}\left\{\liminf _{\epsilon \rightarrow 0^{+}}\left(\frac{p-\epsilon}{p-\epsilon S}\right)^{1 / \epsilon-1 / p}\left(\tilde{A}_{W}(s, p / \epsilon, q / \epsilon)\right)^{1 / \epsilon}\right\} . \tag{3.18}
\end{align*}
$$

For $s>1$, we have $\lim _{\epsilon \rightarrow 0^{+}}\left(\frac{p-\epsilon}{p-\epsilon s}\right)^{1 / \epsilon-1 / p}=e^{(s-1) / p}$. We shall prove

$$
\liminf _{\epsilon \rightarrow 0^{+}}\left(\tilde{A}_{W}(s, p / \epsilon, q / \epsilon)\right)^{1 / \epsilon} \leq \tilde{D}_{O G}(s) .
$$

If so, the desired inequality follows from (3.18). Let $0<\epsilon<p / s$. We have

$$
\begin{align*}
\left(\tilde{A}_{W}(s, p / \epsilon, q / \epsilon)\right)^{1 / \epsilon}= & \sup _{x \in E}\left(\int_{\tilde{S}_{x}}\left(\frac{g(t)}{v(t)}\right)^{\frac{\epsilon}{p-\epsilon}} g(t) d t\right)^{\frac{s-1}{p}} \\
& \times\left(\int_{E \backslash S_{x}}\left\{\int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\frac{\epsilon}{p-\epsilon}} g(y) d y\right\}^{\frac{q(p-\epsilon s)}{\epsilon p}} \frac{u(t) d t}{(G(t))^{q / \epsilon}}\right)^{1 / q} . \tag{3.19}
\end{align*}
$$

The term ' $\left(\int_{\tilde{S}_{x}}(\cdots)\right)^{\frac{s-1}{p} \text { ' }}$ in (3.19) increases in $\|x\|$. On the other hand, the term ' $\left(\int_{E \backslash S_{x}}\{\cdots\}^{q(p-\epsilon s) /(\epsilon p)} \frac{u(t) d t}{(G(t))^{q / \epsilon}}\right)^{1 / q}$ ' in (3.19) is zero for $\|x\|>r$ and it keeps the same value for the change: $x$ with $\|x\|<1 / r \longrightarrow(1 / r) x /\|x\|$. These imply that the term 'sup ${ }_{x \in E}$ ' in (3.19) can be replaced by ' $\sup _{x \in \tilde{\Omega}_{r}}$ '. By the Heine-Borel theorem, we can choose $0<\epsilon_{m}<p / s$, $\alpha_{m}>0$, and $x_{0}, x_{m} \in \tilde{\Omega}_{r}$ such that $\epsilon_{m} \rightarrow 0, \alpha_{m} \rightarrow 0, x_{m} \rightarrow x_{0}$, and the following inequality holds for all $m$ :

$$
\begin{align*}
& \left(\tilde{A}_{W}\left(s, p / \epsilon_{m}, q / \epsilon_{m}\right)\right)^{1 / \epsilon_{m}} \\
& \quad \leq\left(\int_{\tilde{S}_{x_{m}}}\left(\frac{g(t)}{v(t)}\right)^{\frac{\epsilon_{m}}{p-\epsilon_{m}}} g(t) d t\right)^{\frac{s-1}{p}} \\
& \quad \times\left(\int_{E \backslash S_{x_{m}}}\left\{\int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\frac{\epsilon_{m}}{p-\epsilon_{m}}} g(y) d y\right\}^{\frac{q\left(p-\epsilon_{m} s\right)}{\epsilon_{m p}}} \frac{u(t) d t}{(G(t))^{q / \epsilon_{m}}}\right)^{1 / q}+\alpha_{m} \tag{3.20}
\end{align*}
$$

For the first integral in (3.20), we have

$$
\begin{align*}
& \lim _{m \rightarrow \infty}\left(\int_{\tilde{S}_{x_{m}}}\left(\frac{g(t)}{v(t)}\right)^{\frac{\epsilon_{m}}{p-\epsilon_{m}}} g(t) d t\right)^{\frac{s-1}{p}} \\
& \quad=\left(\int_{\tilde{S}_{x_{0}}} \lim _{m \rightarrow \infty}\left\{\left(\frac{g(t)}{v(t)}\right)^{\frac{\epsilon_{m}}{p-\epsilon_{m}}}\right\} g(t) d t\right)^{\frac{s-1}{p}}=\left(G\left(x_{0}\right)\right)^{\frac{s-1}{p}} . \tag{3.21}
\end{align*}
$$

As for the second integral, it follows from Lemma 3.1 that

$$
\begin{align*}
& \left(\int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\frac{\epsilon_{m}}{p-\epsilon_{m}}} g(y) d y\right)^{\frac{q\left(p-\epsilon_{m s}\right)}{\epsilon_{m p}}} \frac{1}{(G(t))^{q / \epsilon_{m}}} \\
& \quad=\left(\int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\frac{\epsilon_{m}}{p-\epsilon_{m}}} g(y) d y\right)^{-q s / p}\left(\frac{1}{G(t)} \int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\frac{\epsilon_{m}}{p-\epsilon_{m}}} g(y) d y\right)^{q / \epsilon_{m}} \\
& \quad \rightarrow(G(t))^{\frac{-q s}{p}}\left\{\exp \left(\frac{1}{G(t)} \int_{\tilde{S}_{t}} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y\right)\right\}^{\frac{q}{p}} \text { as } m \rightarrow \infty . \tag{3.22}
\end{align*}
$$

Moreover, for $m$ large enough,

$$
\begin{aligned}
& \left|\chi_{E \backslash S_{x_{m}}(t)}\left(\int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\frac{\epsilon_{m}}{p-\epsilon_{m}}} g(y) d y\right)^{\frac{q\left(p-\epsilon_{m} s\right)}{\epsilon_{m} p}} \frac{u(t)}{(G(t))^{q / \epsilon_{m}}}\right| \\
& \quad \leq\left\{\sup _{x \in E}\left(\frac{g(y)}{v(y)}\right)+1\right\}^{q / p} \chi_{\tilde{\Omega}_{r}}(t) G(t)^{-q s / p} u(t) \in L^{1}(E, d t) .
\end{aligned}
$$

Integrating the left hand side of (3.22) with respect to $u(t) d t$ first and then applying the Lebesgue dominated convergence theorem, we obtain

$$
\begin{align*}
& \lim _{m \rightarrow \infty}\left(\int_{E \backslash S_{x_{m}}}\left(\int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\frac{\epsilon_{m}}{p-\epsilon_{m}}} g(y) d y\right)^{\frac{q\left(p-\epsilon_{m} s\right)}{\epsilon_{m} p}} \frac{u(t) d t}{(G(t))^{q / \epsilon_{m}}}\right)^{1 / q} \\
&=\left(\int_{E \backslash S_{x_{0}}} \lim _{m \rightarrow \infty}\left\{\frac{1}{(G(t))^{q / \epsilon_{m}}}\left(\int_{\tilde{S}_{t}}\left(\frac{g(y)}{v(y)}\right)^{\frac{\epsilon_{m}}{p-\epsilon_{m}}} g(y) d y\right)^{\frac{q\left(p-\epsilon_{m s)}\right.}{\epsilon_{m p}}}\right\} u(t) d t\right)^{1 / q} \\
&=\left(\int_{E \backslash S_{x_{0}}} \frac{1}{(G(t))^{q s / p}}\left\{\exp \left(\frac{1}{G(t)} \int_{\tilde{S}_{t}} g(y)\left(\log \frac{g(y)}{v(y)}\right) d y\right)\right\}^{\frac{q}{p}} u(t) d t\right)^{\frac{1}{q}} . \tag{3.23}
\end{align*}
$$

Putting (3.20), (3.21), and (3.23) together yields the desired inequality. This finishes the proof.

For other estimates of Hardy-type inequalities, we may use a similar limit process to Theorems 3.2 and 3.3 to get the corresponding Pólya-Knopp inequalities.
